June	7.2	5.9	5.7	5.7	5.8	.	-0.24	1.50
July	6.7	5.9	5.5	.	5.9	.	0.04	0.93
Aug.	0.39	1.57

Sources: ECB, European Commission (Eurostat and Economic and Financial Affairs DG) and Refinitiv.

1) Data refer to the changing composition of the euro area. For further information, see the General Notes.

2) Annual percentage changes for monthly data refer to the end of the month, whereas those for quarterly and yearly data refer to the annual change in the period average. See the Technical Notes for details.

3) M3 and its components exclude holdings by non-euro area residents of money market fund shares/units and debt securities with a maturity of up to two years.

4) Based on AAA-rated euro area central government bond yield curves. For further information, see Section 4.7.

2. Prices, output, demand and labour markets

(annual percentage changes, unless otherwise indicated)

	HICP ¹⁾	Industrial producer prices ²⁾	Hourly labour costs	Real GDP (s.a.)	Industrial production excluding construction ³⁾	Capacity utilisation in manufacturing (%)	Employment (s.a.)	Unemployment (% of labour force; s.a.)
	1	2	3	4	5	6	7	8
2020	0.3	-2.6	2.9	-6.1	-7.7	74.4	-1.5	7.8
2021	2.6	12.3	1.2	5.2	8.0	81.8	1.3	7.7
2021 Q4	4.6	24.0	2.5	4.6	0.2	82.5	2.3	7.1
2022 Q1	6.1	33.1	4.2	5.4	-0.3	82.5	3.0	6.8
Q2	8.0	36.5	4.0	4.1	0.4	82.5	2.7	6.7

Source: ECB.

- From 1 January 1999 to 9 March 2004, the date refers to the deposit and marginal lending facilities. For main refinancing operations, changes in the rate are effective from the first operation following the date indicated. The change on 18 September 2001 was effective on that same day. From 10 March 2004 onwards, the date refers both to the deposit and marginal lending facilities and to the main refinancing operations (with changes effective from the first main refinancing operation following the Governing Council decision), unless otherwise indicated.
- On 22 December 1998 the ECB announced that, as an exceptional measure between 4 and 21 January 1999, a narrow corridor of 50 basis points would be applied between the interest rates for the marginal lending facility and the deposit facility, aimed at facilitating the transition to the new monetary regime by market participants.
- On 8 June 2000 the ECB announced that, starting from the operation to be settled on 28 June 2000, the main refinancing operations of the Eurosystem would be conducted as variable rate tenders. The minimum bid rate refers to the minimum interest rate at which counterparties may place their bids.
- As of 9 October 2008 the ECB reduced the standing facilities corridor from 200 basis points to 100 basis points around the interest rate on the main refinancing operations. The standing facilities corridor was restored to 200 basis points as of 21 January 2009.
- On 8 October 2008 the ECB announced that, starting from the operation to be settled on 15 October, the weekly main refinancing operations would be carried out through a fixed rate tender procedure with full allotment at the interest rate on the main refinancing operations. This change overrode the previous decision (made on the same day) to cut by 50 basis points the minimum bid rate on the main refinancing operations conducted as variable rate tenders.

1.3 Eurosystem monetary policy operations allotted through tender procedures

1.3.1 Main and longer-term refinancing operations ¹⁾

Source: ECB.

Note: The amounts shown may differ slightly from those in Section 1.1 owing to operations that have been allotted but not settled.

Note: With effect from April 2002, split tender operations (i.e. operations with a one-week maturity conducted as standard tender procedures in parallel with a main refinancing operation) are classified as main refinancing operations.

- On 8 June 2000 the ECB announced that, starting from the operation to be settled on 28 June 2000, the main refinancing operations of the Eurosystem would be conducted as variable rate tender procedures. The minimum bid rate refers to the minimum interest rate at which counterparties may place their bids. On 8 October 2008 the ECB announced that, starting from the operation to be settled on 15 October 2008, the weekly main refinancing operations would be carried out through a fixed rate tender procedure with full allotment at the interest rate on the main refinancing operations. On 4 March 2010 the ECB decided to return to variable rate tender procedures in the regular three-month longer-term refinancing operations, starting with the operation to be allotted on 28 April 2010 and settled on 29 April 2010. On 10 June 2010 the ECB decided to revert back to a fixed rate tender procedure.
- In liquidity-providing (absorbing) operations, the marginal rate refers to the lowest (highest) rate at which bids were accepted.
- For the operations settled on 22 December 2011 and 1 March 2012, after one year counterparties have the option to repay any part of the liquidity that they have been allotted in these operations, on any day that coincides with the settlement day of a main refinancing operation.
- Targeted longer-term refinancing operation. Further information can be found in the 'Monetary Policy' section of the ECB's webpage (<https://www.ecb.europa.eu>) under 'Instruments' then 'Open market operations'.
- In this longer-term refinancing operation, the rate at which all bids are satisfied is indexed to the average minimum bid rate in the main refinancing operations over the life of the operation. The interest rates displayed for these indexed longer-term refinancing operations have been rounded to two decimal places. For the precise calculation method, please refer to the Technical Notes.

1.3.2 Other tender operations

(EUR millions; interest rates in percentages per annum)

Date of settlement	Type of operation	Bids (amount)	Number of participants	Allotment (amount)	Fixed rate tender procedures	Variable rate tender procedures				Running for (...) days	
					Fixed rate	Minimum bid rate	Maximum bid rate	Marginal rate ¹⁾	Weighted average rate		
		1	2	3	4	5	6	7	8	9	10
2014 12 Mar.	Collection of fixed-term deposits	219,077	159	175,500	-	-	0.25	0.23	0.21	7

4 June	Collection of fixed-term deposits	119,200	140	119,200	-	-	0.25	0.25	0.24	7	
11 June	Collection of fixed-term deposits	108,650	122	108,650	-	-	0.15	0.15	0.13	7	

Source: ECB.

Note: The amounts shown may differ slightly from those in Section 1.1 owing to operations that have been allotted but not settled.

Note: With effect from April 2002, split tender operations (i.e. operations with a one-week maturity conducted as standard tender procedures in parallel with a main refinancing operation) are classified as main refinancing operations.

- In liquidity-providing (absorbing) operations, the marginal rate refers to the lowest (highest) rate at which bids were accepted.

1.4 Minimum reserve and liquidity statistics

1.4.1 Reserve base of credit institutions subject to reserve requirements

(EUR billions; end of period)

Reserve base as at:	Total	Liabilities to which a 1% reserve coefficient is applied		Liabilities to which a 0% reserve coefficient is applied

Source: ECB.

Note: MFI sector excluding the Eurosystem; sectoral classification is based on the ESA 2010.

Note: Data refer to the changing composition of the euro area. For further information, see the General Notes.

1) In accordance with the ESA 2010, in December 2014 holding companies of non-financial groups were reclassified from the non-financial corporations sector to the financial corporations sector. These entities are included in MFI balance sheet statistics with financial corporations other than MFIs and insurance corporations and pension funds (ICPFs).

2) Covers deposits in columns 2, 3, 5 and 7.

3) Covers deposits in columns 9, 10, 12 and 14.

Note: MFI sector excluding the Eurosystem; sectoral classification is based on the ESA 2010.

Note: Data refer to the changing composition of the euro area. For further information, see the General Notes.

1) In accordance with the ESA 2010, in December 2014 holding companies of non-financial groups were reclassified from the non-financial corporations sector to the financial corporations sector. These entities are included in MFI balance sheet statistics with financial corporations other than MFIs and insurance corporations and pension funds (ICPFs).

2) Covers deposits in columns 2, 3, 5 and 7.

3) Covers deposits in columns 9, 10, 12 and 14.

1) Balancing item as in ESA 2010. The liability of a defined contribution scheme is the current market value of the fund's assets and the fund's net worth is always zero.

The liability of a defined benefit pension scheme is equal to the present value of the promised benefits, and therefore in a defined benefit pension plan net worth can be different from zero.

3 EURO AREA ACCOUNTS

Sources: Eurostat and ECB calculations.

- 1) Data refer to the changing composition of the euro area. For further information, see the General Notes.
- 2) In May 2016 the ECB started publishing enhanced seasonally adjusted HICP series for the euro area, following a review of the seasonal adjustment approach as described in Box 1, Economic Bulletin, Issue 3, ECB, 2016 (<https://www.ecb.europa.eu/pub/pdf/ecbu/eb201603.en.pdf>).
- 3) These experimental statistics can only provide an approximate measure of price administration, since changes in administered prices cannot be fully isolated from other influences. Please refer to Eurostat's website (<http://ec.europa.eu/eurostat/web/hicp/methodology/hicp-administered-prices>) for a note explaining the methodology used in the compilation of this indicator.

Source: European Commission (Economic and Financial Affairs DG).

1) Difference between the percentages of respondents giving positive and negative replies.

2) The economic sentiment indicator is composed of the industrial, services, consumer, construction and retail trade confidence indicators; the industrial confidence indicator has a weight of 40%, the services confidence indicator a weight of 30%, the consumer confidence indicator a weight of 20% and the two other indicators a weight of 5% each. Values for the economic sentiment indicator of above (below) 100 indicate above-average (below-average) economic sentiment, calculated for the period since 1990.

3) Data are collected in January, April, July and October each year. The quarterly figures shown are averages of two successive surveys. Annual data are derived from quarterly averages.

4) The confidence indicators are calculated as simple averages of the components shown; the assessments of stocks (columns 4 and 17) and unemployment (column 10) are used with inverted signs for the calculation of confidence indicators.

- Where annual and quarterly Labour Force Survey data have not yet been published, annual and quarterly data are derived as simple averages of the monthly data. Owing to technical issues with the introduction of the new German system of integrated household surveys, including the Labour Force Survey, the figures for the euro area include data from Germany, starting in Q1 2020, which are not direct estimates from Labour Force Survey microdata, but based on a larger sample including data from other integrated household surveys.
- The job vacancy rate is equal to the number of job vacancies divided by the sum of the number of occupied posts and the number of job vacancies, expressed as a percentage. Industry, construction and services (excluding households as employers and extra-territorial organisations and bodies); non-seasonally adjusted.

5.3.3 Employment - persons employed and hours worked (annual percentage changes)

Source: Eurostat.

- Industry, construction and services (excluding households as employers and extra-territorial organisations and bodies); non-seasonally adjusted.

1) "Other EU Member States outside the euro area" comprises EU Member States and EU institutions outside the euro area

2) "BRIC" includes Brazil, Russia, India and China.

3) "Offshore financial centres" are defined as those countries or jurisdictions outside the EU that provide financial services to non-residents on a scale that is incommensurate with the size and the financing of its domestic economy, including e.g. Hong Kong, Cayman Island and Bermuda.

Source: Eurostat.

Note: Differences between ECB's b.o.p. goods and Eurostat's trade in goods are mainly due to different definitions. While trade statistics consider a transaction to take place when there is a physical movement of goods across borders, the b.o.p. compiler measures goods on a change-of-ownership basis. For more details see Table 1 in the euro area balance of payments and international investment position statistics 2009 quality report.

1) Product groups as classified in the Broad Economic Categories. Unlike the product groups shown in Table 2, intermediate and consumption product groups include agricultural and energy products.

Note: Differences between ECB's b.o.p. goods and Eurostat's trade in goods are mainly due to different definitions. While trade statistics consider a transaction to take place when there is a physical movement of goods across borders, the b.o.p. compiler measures goods on a change-of-ownership basis. For more details see Table 1 in the euro area balance of payments and international investment position statistics 2009 quality report.

1) Product groups as classified in the Main Industrial Groupings. Unlike the product groups shown in Table 7.5.1, intermediate and consumer goods do not include energy products, and agricultural goods are not covered. Manufacturing has a different composition compared with the data shown in columns 7 and 12 of Table 7.5.1. Data shown are price indices which follow the pure price change for a basket of products and are not simple ratios of the value and volume data shown in Table 7.5.1, which are affected by changes in the composition and quality of traded goods. These indices differ from the GDP deflators for imports and exports (shown in Table 5.1.3), mainly because those deflators include all goods and services and cover cross-border trade within the euro area.

2) Industrial producer export prices refer to direct transactions between domestic producers and non-domestic customers. Contrary to the data shown for values and volumes in Table 7.5.1, exports from wholesalers and re-exports are not covered. Index covers sales to the non-euro area countries only.

3) Index covers import prices from non-euro area countries only.

7.5 Trade in goods

Euro area overview

Calculation of growth rates for monetary developments

The average growth rate for the quarter ending in month t is calculated as:

$$(1.1) \left(\frac{0.5I_t + \sum_{i=1}^2 I_{t-i} + 0.5I_{t-3}}{0.5I_{t-12} + \sum_{i=1}^2 I_{t-i-12} + 0.5I_{t-15}} - 1 \right) \times 100$$

where I_t is the index of adjusted outstanding amounts as at month t (see also below). Likewise, for the year ending in month t , the average growth rate is calculated as:

$$(1.2) \left(\frac{0.5I_t + \sum_{i=1}^{11} I_{t-i} + 0.5I_{t-12}}{0.5I_{t-12} + \sum_{i=1}^{11} I_{t-i-12} + 0.5I_{t-24}} - 1 \right) \times 100$$

Section 1.3

Calculation of interest rates on indexed longer-term refinancing operations

The interest rate on an indexed longer-term refinancing operation (LTRO) is equal to the average of the minimum bid rates on the main refinancing operations (MROs) over the life of that LTRO. According to this definition, if an LTRO is outstanding for D number of days and the minimum bid rates prevailing in MROs are $R_{1,MRO}$ (over D_1 days), $R_{2,MRO}$ (over D_2 days), etc., until $R_{n,MRO}$ (over D_n days) the applicable annualised rate (R_{LTRO}) is calculated as:

$$(1.3) R_{LTRO} = \frac{\sum_i^n D_i R_{i,MRO}}{\sum_i^n D_i}$$

Sections 2.1 to 2.6

Calculation of transactions

Monthly transactions are calculated from monthly differences in outstanding amounts adjusted for reclassifications, other revaluations, exchange rate variations and any other changes which do not arise from transactions.

If L_t represents the outstanding amount at the end of month t , C_t^M the reclassification adjustment in month t , E_t^M the exchange rate adjustment and V_t^M the other revaluation adjustments, the transactions F_t^M in month t are defined as:

$$(1.4) F_t^M = (L_t - L_{t-1}) - C_t^M - E_t^M - V_t^M$$

Similarly, the quarterly transactions F_t^Q for the quarter ending in month t are defined as:

$$(1.5) F_t^Q = (L_t - L_{t-3}) - C_t^Q - E_t^Q - V_t^Q$$

where L_{t-3} is the amount outstanding at the end of month $t-3$ (the end of the previous quarter) and, for example, C_t^Q is the reclassification adjustment in the quarter ending in month t .

For those quarterly series for which monthly observations are now available (see below), the quarterly transactions can be derived as the sum of the three monthly transaction figures in the quarter.

Calculation of growth rates for monthly series

Growth rates can be calculated from transactions or from the index of adjusted outstanding amounts. If F_t^M and L_t are defined as above, the index I_t of adjusted outstanding amounts in month t is defined as:

$$(1.6) I_t = I_{t-1} \times \left(1 + \frac{F_t^M}{L_{t-1}} \right)$$

The base of the index (for the non-seasonally adjusted series) is currently set as December 2010 = 100. Time series for the index of adjusted outstanding amounts are available on the ECB's website (<http://www.ecb.europa.eu/stats/money/aggregates/aggr/html/index.en.html>).

The annual growth rate a_t for month t – i.e. the change in the 12 months ending in month t – can be calculated using either of the following two formulae:

$$(1.7) a_t = \left(\prod_{i=0}^{11} \left(1 + \frac{F_{t-1-i}^M}{L_{t-1-i}} \right) - 1 \right) \times 100$$

$$(1.8) a_t = \left(\frac{I_t}{I_{t-12}} - 1 \right) \times 100$$

Unless otherwise indicated, the annual growth rates refer to the end of the indicated period. For example, the annual percentage change for the year 2002 is calculated in formula (1.8) by dividing the index for December 2002 by the index for December 2001.

Growth rates for intra-annual periods can be derived by adapting formula (1.8). For example, the month-on-month growth rate a_t^M can be calculated as:

$$(1.9) \quad a_t^M = \left(\frac{I_t}{I_{t-1}} - 1 \right) \times 100$$

Finally, the three-month moving average (centred) for the annual growth rate of M3 is obtained as $(a_{t+1} + a_t + a_{t-1})/3$, where a_t is defined as in formula (1.7) or (1.8) above.

Calculation of growth rates for quarterly series

If F_t^Q and L_{t-3} are defined in formula (1.5), the index I_t of adjusted outstanding amounts for the quarter ending in month t is defined as:

$$(1.10) \quad I_t = I_{t-3} \times \left(1 + \frac{F_t^Q}{L_{t-3}} \right)$$

The annual growth rate in the four quarters ending in month t (i.e. a_t) can be calculated using formula (1.8).

Seasonal adjustment of the euro area monetary statistics¹

The approach used for seasonal adjustment of the euro area monetary statistics is based on multiplicative decomposition using X-12-ARIMA². The seasonal adjustment may include a day-of-the-week adjustment, and for some series it is carried out indirectly by means of a linear combination of components. This is the case for M3, which is derived by aggregating the seasonally adjusted series for M1, M2 less M1, and M3 less M2.

The seasonal adjustment procedures are first applied to the index of adjusted outstanding amounts.³ The resulting estimates of seasonal factors are then applied to the levels and to the adjustments arising from reclassifications and revaluations, in turn yielding seasonally adjusted transactions. Seasonal (and trading day) factors are revised at annual intervals or as required.

¹ For details, see "Seasonal adjustment of monetary aggregates and HICP for the euro area", ECB, August 2000 and the "Monetary and financial statistics" sub-section of the "Statistics" section of the ECB's website (<http://www.ecb.europa.eu/stats/money/aggregates/aggr/html/index.en.html>).

² For details, see Findley, D., Monsell, B., Bell, W., Otto, M. and Chen, B. C., "New Capabilities and Methods of the X-12-ARIMA Seasonal Adjustment Program", *Journal of Business and Economic Statistics*, 16, 2, 1998, pp.127-152, or "X-12-ARIMA Reference Manual", U.S. Census Bureau, Washington, D.C. For internal purposes, the model-based approach of TRAMO-SEATS is also used. For details of TRAMO-SEATS, see Gómez, V. and Maravall, A., "Programs TRAMO and SEATS: Instructions for the User", Banco de España, Working Paper No 9628, Madrid, 1996.

³ It follows that for the seasonally adjusted series, the level of the index for the base period (i.e. December 2008) generally differs from 100, reflecting the seasonality of that month.

Sections 3.1 to 3.5

Equality of uses and resources

In Section 3.1 the data conform to a basic accounting identity. For non-financial transactions, total uses equal total resources for each transaction category. This accounting identity is also reflected in the financial account i.e. for each financial instrument category, total transactions in financial assets equal total transactions in liabilities. In the other changes in assets account and the financial balance sheets, total assets equal total liabilities for each financial instrument category, with the exception of monetary gold and special drawing rights, which are by definition not a liability of any sector.

Calculation of balancing items

The balancing items at the end of each account in Sections 3.1, 3.2 and 3.3 are computed as follows.

The trade balance equals euro area imports minus exports vis-à-vis the rest of the world for goods and services.

Net operating surplus and mixed income is defined for resident sectors only and is calculated as gross value added (gross domestic product at market prices for the euro area) minus compensation of employees (uses) minus other taxes less subsidies on production (uses) minus consumption of fixed capital (uses).

Net national income is defined for resident sectors only and is computed as net operating surplus and mixed income plus compensation of employees (resources) plus taxes less subsidies on production (resources) plus net property income (resources minus uses).

Net disposable income is also defined only for resident sectors and equals net national income plus net current taxes on income and wealth (resources minus uses) plus net social contributions (resources minus uses) plus net social benefits other than social transfers in kind (resources minus uses) plus net other current transfers (resources minus uses).

Net saving is defined for resident sectors and is calculated as net disposable income plus the net adjustment for the change in the net equity of households in pension fund reserves (resources minus uses) minus final consumption expenditure (uses). For the rest of the world, the current external account is compiled as the trade balance plus all net income (resources minus uses).

Net lending/net borrowing is computed from the capital account as net saving plus net capital transfers (resources minus uses) minus gross capital formation (uses) minus acquisitions less disposals of non-produced non-financial assets (uses) plus consumption of fixed capital (resources). It can also be calculated in the financial account as total transactions in financial assets minus total transactions in financial liabilities (also known as changes in net financial worth (wealth) due to transactions).

For the household and non-financial corporation sectors, there is a statistical discrepancy between the balancing items computed from the capital account and the financial account.

Changes in net financial worth (wealth) due to transactions are computed as total transactions in financial assets minus total transactions in financial liabilities, whereas other changes in net financial worth (wealth) are calculated as (total) other changes in financial assets minus (total) other changes in financial liabilities.

Net financial worth (wealth) is calculated as total financial assets minus total financial liabilities, whereas changes in net financial worth (wealth) are equal to the sum of changes in net financial worth (wealth) due to transactions (lending/net borrowing from the financial account) and other changes in net financial worth (wealth).

Changes in net worth (wealth) are calculated as changes in net worth (wealth) due to savings and capital transfers plus other changes in net financial worth (wealth) and other changes in non-financial assets.

The net worth (wealth) of households is calculated as the sum of the non-financial assets and net financial worth (wealth) of households.

Annual growth rates for financial transactions

The annual growth rate $g(f_t)$ for financial transactions is calculated as:

$$(1.11) \quad g(f_t) = \left(\frac{\sum_{i=0}^3 f_{t-i}}{F_{t-4}} \right) \times 100$$

where f_t stands for the transactions in quarter t , and F_{t-4} for the end-of-quarter stock value four quarters earlier.

Sections 4.1, 4.2 and 4.3

Calculation of growth rates for debt securities and listed shares

Growth rates are calculated on the basis of financial transactions and therefore exclude reclassifications, revaluations, exchange rate variations and any other changes which do not arise from transactions. They can be calculated from transactions or from an index of notional stocks. If N_t^M represents the transactions (net issues) in month t and L_t the level outstanding at the end of month t , the index I_t of notional stocks in month t is defined as:

$$(1.12) \quad I_t = I_{t-1} \times \left(1 + \frac{N_t^M}{L_{t-1}} \right)$$

The base of the index is set equal to 100 in December 2020. For selected time series on debt securities at face value, which have been extended with historical data from

the discontinued securities issues statistics, the base of the index is set equal to 100 in December 2008. The growth rate a_t for month t , corresponding to the change in the 12 months ending in month t , can be calculated using either of the following two formulae:

$$(1.13) \quad a_t = \left(\prod_{i=0}^{11} \left(1 + \frac{N_{t-i}^M}{L_{t-1-i}} \right) - 1 \right) \times 100$$

$$(1.14) \quad a_t = \left(\frac{I_t}{I_{t-12}} - 1 \right) \times 100$$

The method used to calculate the growth rates for debt securities (Sections 4.1 and 4.2) and listed shares (Section 4.3) is the same as that used for the monetary aggregates, the only difference being that an “N” is used instead of an “F”. This is to show that the method used to obtain “net issues” for securities issues statistics differs from that used to calculate equivalent “transactions” for the monetary aggregates.

The average growth rate for the quarter ending in month t is calculated as:

$$(1.15) \quad \left(\frac{0.5I_t + \sum_{i=1}^2 I_{t-i} + 0.5I_{t-3}}{0.5I_{t-12} + \sum_{i=1}^2 I_{t-i-12} + 0.5I_{t-15}} - 1 \right) \times 100$$

where I_t is the index of notional stocks as at month t . Likewise, for the year ending in month t , the average growth rate is calculated as:

$$(1.16) \quad \left(\frac{0.5I_t + \sum_{i=1}^{11} I_{t-i} + 0.5I_{t-12}}{0.5I_{t-12} + \sum_{i=1}^{11} I_{t-i-12} + 0.5I_{t-24}} - 1 \right) \times 100$$

Section 5.1

Seasonal adjustment of the Harmonised Index of Consumer Prices (HICP)

The approach used is based on multiplicative decomposition using X-13 and JDemetra+. The seasonal adjustment of the overall HICP for the euro area is carried out indirectly by aggregating the seasonally adjusted euro area series for processed food, unprocessed food, industrial goods excluding energy, and services. Energy is added without adjustment, since there is no statistical evidence of seasonality. Where applicable and appropriate, euro area HICPs are also adjusted for calendar effects. For additional information, see the box entitled "Harmonised Index of Consumer Prices - Easter effects and improved seasonal adjustment", Economic Bulletin, Issue 3, ECB, 2016. Seasonal factors are revised at annual intervals or as required.

Section 7.2

Seasonal adjustment of the balance of payments current account

The approach used is based on multiplicative decomposition, using JDemetra+ platform and selecting either X-12-ARIMA or TRAMO-SEATS method depending on the item. The raw data for goods, services, primary income and secondary income are pre-adjusted in order to take into account significant working day effects. The working day adjustment for goods and services takes account of national public holidays. The seasonal adjustment of these four items of the current account is carried out using these pre-adjusted series. The seasonal adjustment of the total current account is carried out by aggregating the seasonally adjusted euro area series for goods, services, primary income and secondary income. Seasonal (and trading day) factors are revised at biannual intervals or as required.

Section 7.3

Calculation of growth rates for the quarterly and annual series

The annual growth rate for quarter t is calculated on the basis of quarterly transactions (F) and positions (L) as follows:

$$(1.17) \quad a_t = \left(\prod_{i=t-3}^t \left(1 + \frac{F_i}{L_{i-1}} \right) - 1 \right) \times 100$$

The growth rate for the annual series is equal to the growth rate in the last quarter of the year.

General notes

The Statistics Bulletin focuses on statistics for the euro area as a whole. More detailed and longer runs of data, with further explanatory notes, are available in the "Statistics" section of the ECB's website (<https://www.ecb.europa.eu>). This allows user-friendly access to data via the ECB's Statistical Data Warehouse (SDW) (<https://sdw.ecb.europa.eu>), which includes search and download facilities. For further information, please [contact us](#).

Unless otherwise indicated, all data series including observations for 2015 relate to the group of 19 countries that are members of the euro area (the Euro 19) for the whole time series. For interest rates, balance sheets and monetary statistics, the HICP and reserve assets (and, for consistency reasons, the components and counterparts of M3 and the components of the HICP), euro area statistical series refer to the changing composition of the euro area.

The composition of the euro area has changed a number of times over the years. When the euro was introduced in 1999, the euro area comprised the following 11 countries (the Euro 11): Belgium, Germany, Ireland, Spain, France, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland. Greece then joined in 2001, forming the Euro 12. Slovenia joined in 2007, forming the Euro 13; Cyprus and Malta joined in 2008, forming the Euro 15; Slovakia joined in 2009, forming the Euro 16; and Estonia joined in 2011, forming the Euro 17. Latvia joined in 2014 and Lithuania in 2015, bringing the number of euro area countries to 19. From October 2012, the euro area statistics also include the European Stability Mechanism (ESM), an international organisation resident in the euro area for statistical purposes.

Euro area series with a fixed composition

Aggregated statistical series for fixed compositions of the euro area are based on a given fixed composition for the whole time series, regardless of the composition at the time to which the statistics relate. For example, aggregated series are calculated for the Euro 19 for all years, despite the fact that the euro area has only had this composition since 1 January 2015. Unless otherwise indicated, the ECB's Statistics Bulletin provides statistical series for the current composition.

Euro area series with a changing composition

Aggregated statistical series with a changing composition take into account the composition of the euro area at the time to which the statistics relate. Such series aggregate the data of the Euro 11 for the period up to the end of 2000, the Euro 12 for the period from 2001 to the end of 2006, and so on. With this approach, each

individual statistical series covers all of the various compositions of the euro area.

For the HICP, as well as statistics based on the balance sheet of the MFI sector ("monetary statistics") and of other financial corporations, rates of change are compiled from chain-linked indices, with the new composition introduced by the linking factor at the point of enlargement. Thus, if a country joins the euro area in January of a given year, the factors contributing to the chain-linked indices relate to the previous composition of the euro area up to and including December of the previous year, and the enlarged composition of the euro area thereafter. For further details on monetary statistics, refer to the "Manual on MFI balance sheet statistics", available in the "Statistics" section of the ECB's website under "Monetary and financial statistics".

Given that the composition of the European currency unit (ECU) does not coincide with the former currencies of the countries that have adopted the single currency, pre-1999 amounts originally expressed in the participating currencies and converted into ECU at ECU exchange rates are affected by movements in the currencies of EU Member States that have not adopted the euro. To avoid this effect on the monetary statistics, pre-1999 data¹ are expressed in units converted from national currencies at the irrevocable euro exchange rates established on 31 December 1998. Unless otherwise indicated, price and cost statistics before 1999 are based on data expressed in national currency terms.

Methods of aggregation and/or consolidation (including cross-country consolidation) have been used where appropriate.

Recent data are often provisional and may be revised. Discrepancies between totals and their components may arise from rounding.

The group "other EU Member States" comprises (unless otherwise indicated) Bulgaria, the Czech Republic, Denmark, Croatia, Hungary, Poland, Romania and Sweden.

In most cases, the terminology used within the tables follows international standards, such as those contained in the European System of Accounts and the IMF's Balance of Payments and International Investment Position Manual. Transactions refer to voluntary exchanges (measured directly or derived), while flows also encompass changes in outstanding amounts owing to price and exchange rate changes, write-offs and other changes.

In the tables, the wording "up to (x) years" means "up to and including (x) years".

Overview

Developments in key indicators for the euro area are summarised in an overview table.

¹ Data on monetary statistics in Sections 2.1 to 2.8 are available for periods prior to January 1999 on the ECB's website (<http://www.ecb.europa.eu/stats/services/downloads/html/index.en.html>) and in the SDW (<http://sdw.ecb.europa.eu/browse.do?node=2018811>).

Monetary policy statistics

Section 1.4 shows statistics on minimum reserves and liquidity factors. Maintenance periods for minimum reserve requirements start every month on the settlement day of the main refinancing operation (MRO) following the Governing Council meeting for which the monthly assessment of the monetary policy stance is scheduled. They end on the day preceding the corresponding settlement day in the following month. Annual/quarterly observations refer to averages for the last reserve maintenance period of the year/quarter.

Table 1 in Section 1.4 shows the components of the reserve base of credit institutions subject to reserve requirements. Liabilities vis-à-vis other credit institutions subject to the ESCB's minimum reserve system, the ECB and euro area national central banks (NCBs) are excluded from the reserve base. When a credit institution cannot provide evidence of the amount of its issues of debt securities with a maturity of up to two years which are held by the institutions mentioned above, it may deduct a certain percentage of these liabilities from its reserve base. The percentage used to calculate the reserve base was 10% until November 1999 and has been 30% since that date.

Table 2 in Section 1.4 contains average data for completed maintenance periods. First, the reserve requirement of each individual credit institution is calculated by applying the reserve ratios for the corresponding categories of liability to the eligible liabilities, using the balance sheet data from the end of each calendar month. Subsequently, each credit institution deducts from this figure a lump-sum allowance of €100,000. The resulting required reserves are then aggregated at the euro area level (column 1). Current account holdings (column 2) are the aggregate average daily current account holdings of credit institutions, including those that serve to fulfil reserve requirements. Excess reserves (column 3) are the average current account holdings over the maintenance period in excess of the required reserves. Deficiencies (column 4) are defined as the average shortfalls of current account holdings from required reserves over the maintenance period, computed on the basis of those credit institutions that have not fulfilled their reserve requirements. The interest rate on minimum reserves (column 5) is equal to the average, over the maintenance period, of the ECB's interest rate (weighted according to the number of calendar days) on the Eurosystem's MROs (see Section 1.3).

Table 3 in Section 1.4 shows the banking system's liquidity position, which is defined as euro area credit institutions' current account holdings with the Eurosystem in euro. All amounts are derived from the consolidated financial statement of the Eurosystem. Other liquidity-absorbing operations (column 7) exclude the issuance of debt certificates initiated by NCBs in Stage Two of Economic and Monetary Union (EMU). Net other factors (column 10) represent the netted remaining items in the consolidated financial statement of the Eurosystem. Credit institutions' current accounts (column 11) are equal to the difference between the sum of liquidity-providing factors (columns 1 to 5) and the sum of liquidity-absorbing factors (columns 6 to 10). Base money (column 12) is calculated as the sum of the deposit facility (column 6), banknotes in circulation (column 8) and credit institutions' current account holdings (column 11).

Money, banking and other financial corporations

Section 2 shows balance sheet statistics for MFIs and other financial corporations. Other financial corporations comprise investment funds (other than money market funds, which are part of the MFI sector), financial vehicle corporations, insurance corporations and pension funds.

Section 2.1 shows the aggregated balance sheet of the MFI sector, i.e. the sum of the harmonised balance sheets of all MFIs resident in the euro area. MFIs comprise central banks, credit institutions as defined under EU law, money market funds and other institutions whose business it is to receive deposits and/or close substitutes for deposits from entities other than MFIs and, for their own account (at least in economic terms), to grant credit and/or make investments in securities. A complete list of MFIs is published on the ECB's website.

Section 2.2 shows the consolidated balance sheet of the MFI sector, which is obtained by netting the aggregated balance sheet positions of MFIs in the euro area. Owing to small differences in recording practices, the sum of the inter-MFI positions is not necessarily zero; the balance is shown in column 10 of the liabilities side of Section 2.2. Section 2.3 sets out the euro area monetary aggregates and counterparts. These are derived from the consolidated MFI balance sheet and include positions of non-MFIs resident in the euro area held with MFIs resident in the euro area; they also take account of some monetary assets/liabilities of central government. Statistics on monetary aggregates and counterparts are adjusted for seasonal and trading day effects. The external liabilities item in Sections 2.1 and 2.2 shows the holdings by non-euro area residents of: (i) shares/units issued by money market funds located in the euro area; and (ii) debt securities issued with a maturity of up to two years by MFIs located in the euro area. In Section 2.3, however, these holdings are excluded from the monetary aggregates and contribute to the item "net external assets".

Section 2.4 provides data, broken down by sector, type and original maturity, on loans granted by MFIs other than the Eurosystem (i.e. the banking system) resident in the euro area. Section 2.5 provides data, broken down by sector and instrument, on deposits held with the euro area banking system. Section 2.6 shows the securities held by the euro area banking system, broken down by type of issuer. Section 2.7 shows a quarterly currency breakdown for selected MFI balance sheet items.

Sections 2.3 to 2.6 also provide growth rates based on those transactions in the form of annual percentage changes.

Since 1 January 1999 statistical information has been collected and compiled on the basis of various ECB regulations concerning the balance sheet of the MFI sector. Since December 2014 this has been carried out on the basis of Regulation ECB/2013/33². Detailed sector definitions are set out in the third edition of the ECB's "Monetary financial institutions and markets statistics sector manual – Guidance for the statistical classification of customers" available at <http://www.ecb.europa.eu/pub/pdf/other/mfmarketstatisticssectormanual200703en.pdf>.

Section 2.8 shows outstanding amounts and transactions on the balance sheet of

² OJ L 297, 7.11.2013, p. 1.

euro area investment funds (other than money market funds, which are included in the MFI balance sheet statistics). An investment fund is a collective investment undertaking that invests capital raised from the public in financial and/or non-financial assets. A complete list of euro area investment funds is published on the ECB's website. The balance sheet is aggregated, so investment funds' assets include their holdings of shares/units issued by other investment funds. Shares/units issued by investment funds are also broken down by investment policy (i.e. into bond funds, equity funds, mixed funds, real estate funds, hedge funds and other funds) and by type (i.e. into open-end funds and closed-end funds). Section 2.9 provides further details on the main types of securities held by euro area investment funds. This section contains a geographical breakdown of the issuers of securities held by investment funds, as well as a breakdown by economic sector for issuers resident in the euro area.

Since December 2008 harmonised statistical information has been collected and compiled on the basis of an ECB regulation concerning statistics on the assets and liabilities of investment funds. Since December 2014 this has been carried out on the basis of Regulation ECB/2013/38³. Further information on these investment fund statistics can be found in the ECB's "Manual on investment fund statistics" available at <http://www.ecb.europa.eu/pub/pdf/other/manualinvestmentfundstatistics200905en.pdf>.

Section 2.10 shows the aggregated balance sheet of financial vehicle corporations (FVCs) resident in the euro area. FVCs are entities which are set up in order to carry out securitisation transactions. Securitisation generally involves the transfer of an asset or pool of assets to an FVC, with such assets reported on the FVC's balance sheet as securitised loans, securities other than shares, or other securitised assets. Alternatively, the credit risk relating to an asset or pool of assets may be transferred to an FVC through credit default swaps, guarantees or other such mechanisms. Collateral held by the FVC against these exposures is typically a deposit held with an MFI or invested in securities other than shares. FVCs typically securitise loans which have been originated by the MFI sector. FVCs must report such loans on their statistical balance sheet, regardless of whether the relevant accounting rules allow the MFI to derecognise the loans. Data on loans which are securitised by FVCs but remain on the balance sheet of the relevant MFI (and thus remain in the MFI statistics) are provided separately. These quarterly data have been collected under an ECB regulation as of December 2009. Since December 2014 the data collection has been carried out on the basis of Regulation ECB/2013/40⁴.

Section 2.11 shows the aggregated balance sheet of insurance corporations and pension funds resident in the euro area. Insurance corporations cover both the insurance and reinsurance sectors. Pension funds include entities which have autonomy in terms of decision-making and keep a complete set of accounts (i.e. autonomous pension funds). This section also contains a geographical and sectoral breakdown of the issuers of securities other than shares held by insurance corporations and pension funds.

³ OJ L 297, 7.11.2013, p. 73.

⁴ OJ L 297, 7.11.2013, p. 107.

Euro area accounts

Section 3.1 shows quarterly integrated euro area accounts data, which provide comprehensive information on the economic activities of households (including non-profit institutions serving households), non-financial corporations, financial corporations and general government, as well as on the interaction between these sectors and both the euro area and the rest of the world. Non-seasonally adjusted data at current prices are displayed for the last available quarter, following a simplified sequence of accounts in accordance with the methodological framework of the European System of Accounts 2010.

In short, the sequence of accounts (showing transactions) comprises: (1) the generation of income account, which shows how production activity translates into various categories of income; (2) the allocation of primary income account, which records receipts and expenses relating to various forms of property income (for the economy as a whole; the balancing item of the primary income account is national income); (3) the secondary distribution of income account, which shows how the national income of an institutional sector changes because of current transfers; (4) the use of income account, which shows how disposable income is spent on consumption or saved; (5) the capital account, which shows how savings and net capital transfers are spent in the acquisition of non-financial assets (the balancing item of the capital account is net lending/net borrowing); and (6) the financial account, which records the net acquisitions of financial assets and the net incurrence of liabilities. As each non-financial transaction is mirrored by a financial transaction, the balancing item of the financial account conceptually also equals net lending/net borrowing as calculated in the capital account.

In addition, opening and closing financial balance sheets are presented, which provide a picture of the financial wealth of each individual sector at a given point in time. Finally, other changes in financial assets and liabilities, in particular revaluations (e.g. those resulting from changes in asset prices) are shown.

The sectoral coverage of the financial account and the financial balance sheets is more detailed for the financial corporation sector, which is broken down into MFIs (a further breakdown with separate entries for the Eurosystem and for monetary financial institutions excluding the Eurosystem is also available)⁵, investment funds (other than money market funds), other financial institutions (OFIs, including financial auxiliaries and captive financial institutions), and insurance corporations and pension funds (also available separately).

Section 3.2 shows four-quarter cumulated flows (transactions and other changes) for households' income, expenditure and accumulation accounts, as well as outstanding amounts in the financial and non-financial balance sheet accounts, presenting data in a more analytical manner. Sector-specific transactions and balancing items are arranged in a way that more clearly depicts the financing and investment decisions of households, while respecting the accounting identities presented in Section 3.1.

Sections 3.3 and 3.4 display four-quarter cumulated flows (transactions) for,

⁵ For further details see the methodological note: "Explanatory note accompanying the Eurosystem balance sheet in the Financial Accounts", available on the ECB's website (https://www.ecb.europa.eu/stats/pdf/eea/Explanatory_note-Eurosystem_balance_sheet-Financial_Accounts.pdf).

respectively, non-financial corporations' and financial corporations' income and accumulation accounts, as well as outstanding amounts for the financial balance sheet accounts, presenting data in a more analytical manner.

Section 3.5 shows summary indicators and charts for households and non-financial corporations.

Financial markets

The series on financial market statistics for the euro area cover those EU Member States that had adopted the euro at the time to which the statistics relate (i.e. a changing composition), with the exception of statistics on securities issues (Sections 4.1 to 4.4), which relate to the Euro 18 for the whole time series (i.e. a fixed composition).

Statistics on securities other than shares and statistics on listed shares (Sections 4.1 to 4.4) are produced by the ECB using data from the ESCB and the Bank for International Settlements (BIS). Section 4.5 presents MFI interest rates on euro-denominated deposits from and loans to euro area residents. Statistics on money market interest rates, long-term government bond yields and stock market indices (Sections 4.6 to 4.8) are produced by the ECB using data from wire services.

Statistics on securities issues cover: (i) debt securities (ESA 2010 category F.3) and (ii) listed shares (ESA 2010 category F.511) excluding shares/units issued by money market funds and other investment funds. The former are presented in Sections 4.1, 4.2 and 4.3, while the latter are presented in Section 4.4. Debt securities are broken down into short-term and long-term securities. "Short term" means securities with an original maturity of one year or less, even if they are issued under longer-term facilities. Long-term debt securities comprise securities that have an original maturity of more than one year. Issues with optional maturity dates, the latest of which is more than one year away, and issues with indefinite maturity dates are classified as long term. Long-term debt securities issued by euro area residents are broken down further into fixed and variable rate issues. Fixed rate issues consist of debt securities whose coupon remains unchanged for the life of the security. Variable rate issues comprise debt securities whose coupon rate and/or underlying principal are linked to a general price index for goods and services (such as the consumer price index), an interest rate, or an asset price which results in a variable nominal coupon payment over the life of the issue. For the purposes of securities issues statistics, mixed interest rate debt securities are classified as variable interest rate debt securities. The euro-denominated securities indicated in Sections 4.1, 4.2 and 4.3 also include items expressed in national denominations of the euro.

Section 4.1 shows securities other than shares, broken down by original maturity, residency of the issuer and currency. It presents outstanding amounts, gross issues and net issues of securities other than shares, broken down into: (i) issues denominated in euro and issues in all currencies; (ii) issues by euro area residents and total issues; and (iii) total and long-term maturities. Net issues differ from the changes in outstanding amounts owing to valuation changes, reclassifications and

other adjustments. This section also presents seasonally adjusted statistics, including six-month annualised seasonally adjusted growth rates for total and long-term debt securities. Seasonally adjusted data are derived from the index of notional stocks, from which the seasonal effects have been removed. See the Technical Notes for details.

Section 4.2 contains a sectoral breakdown of outstanding amounts, gross issues and net issues for issuers resident in the euro area in line with the ESA 2010. The ECB is included in the Eurosystem.

The total outstanding amounts for total and long-term debt securities in column 1 of Table 1 in Section 4.2 correspond to the data on outstanding amounts for total and long-term debt securities issued by euro area residents in column 7 of Section 4.1. The outstanding amounts for total and long-term debt securities issued by MFIs in column 2 of Table 1 in Section 4.2 are broadly comparable with the data on debt securities issued on the liabilities side of the aggregated MFI balance sheet in column 8 of Table 2 in Section 2.1. The total net issues for total debt securities in column 1 of Table 2 in Section 4.2 correspond to the data on total net issues by euro area residents in column 9 of Section 4.1. The residual difference between long-term debt securities and total fixed and variable rate long-term debt securities in Table 1 of Section 4.2 consists of zero coupon bonds and revaluation effects.

Section 4.3 shows seasonally adjusted and non-seasonally adjusted growth rates for debt securities issued by euro area residents (broken down by maturity, type of instrument, sector of the issuer and currency), which are based on financial transactions that occur when an institutional unit incurs or redeems liabilities. The growth rates therefore exclude reclassifications, revaluations, exchange rate variations and any other changes that do not arise from transactions. The seasonally adjusted growth rates have been annualised for presentational purposes. See the Technical Notes for details.

Columns 1, 4, 6 and 8 in Table 1 of Section 4.4 show the outstanding amounts of listed shares issued by euro area residents broken down by issuing sector. The monthly data for listed shares issued by non-financial corporations correspond to the quarterly series shown in Section 3.4 (financial balance sheet; listed shares).

Columns 3, 5, 7 and 9 in Table 1 of Section 4.4 show annual growth rates for listed shares issued by euro area residents (broken down by the sector of the issuer), which are based on financial transactions that occur when an issuer issues or redeems shares for cash, excluding investments in the issuer's own shares. The calculation of annual growth rates excludes reclassifications, revaluations and any other changes that do not arise from transactions.

Section 4.5 presents statistics on all the interest rates that MFIs resident in the euro area apply to euro-denominated deposits and loans vis-à-vis households and non-financial corporations resident in the euro area. Euro area MFI interest rates are calculated as a weighted average (by corresponding business volume) of the euro area countries' interest rates for each category.

MFI interest rate statistics are broken down by type of business coverage, sector, instrument category and maturity, and period of notice or initial period of interest rate fixation. These MFI interest rate statistics replaced the ten transitional statistical

series on euro area retail interest rates that had been published in the ECB's Monthly Bulletin January 1999.

Section 4.6 presents money market interest rates for the euro area, the United States and Japan. For the euro area, a broad spectrum of money market interest rates is covered, ranging from interest rates on overnight deposits to those on twelve-month deposits. Before January 1999, synthetic euro area interest rates were calculated on the basis of national rates weighted by gross domestic product. With the exception of the overnight rate prior to January 1999, monthly, quarterly and yearly values are period averages. Overnight deposits are represented by end-of-period interbank deposit bid rates up to and including December 1998 and period averages for the euro overnight index average (EONIA) thereafter. As of January 1999, euro area interest rates on one, three, six and twelve-month deposits are euro interbank offered rates (EURIBOR); prior to that date, they are London interbank offered rates (LIBOR) where available. For the United States and Japan, interest rates on three-month deposits are represented by LIBOR.

Section 4.7 shows end-of-period rates estimated from nominal spot yield curves based on AAA-rated euro-denominated bonds issued by euro area central governments. The yield curves are estimated using the Svensson model⁶. Spreads between the ten-year rates and the three-month and two-year rates are also shown. Additional yield curves (daily releases, including charts and tables) and the corresponding methodological information are available on the ECB's website at <http://www.ecb.europa.eu/stats/money/yc/html/index.en.html>, where daily data can also be downloaded.

Section 4.8 shows stock market indices for the euro area, the United States and Japan.

Prices, output, demand and labour markets

Most of the data described in this section are produced by the European Commission (mainly Eurostat) and national statistical authorities. Euro area results are obtained by aggregating data for individual countries. As far as possible, the data are harmonised and comparable. Statistics on labour cost indices, GDP and expenditure components, value added by economic activity, industrial production, retail sales, passenger car registrations and employment in terms of hours worked are working day-adjusted.

The Harmonised Index of Consumer Prices (HICP) for the euro area (Table 1 in Section 5.1) is based on national HICPs, which follow the same methodology in all euro area countries. The breakdown into goods and services components is derived from the Classification of Individual Consumption by Purpose (COICOP/HICP). The HICP covers monetary expenditure by households on final consumption in the economic territory of the euro area. The table includes seasonally adjusted HICP data, which are compiled by the ECB, and HICP-based indices of administered prices.

⁶ Svensson, L.E., "Estimating and Interpreting Forward Interest Rates: Sweden 1992-1994", *CEPR Discussion Papers*, No 1051. Centre for Economic Policy Research, London, 1994.

Industrial producer prices (Table 2 in Section 5.1), industrial production, industrial turnover and retail sales (Section 5.2) are covered by Council Regulation (EC) No 1165/98 of 19 May 1998 concerning short-term statistics⁷. Since January 2009 the revised classification of economic activities (NACE Revision 2) as covered by Regulation (EC) No 1893/2006 of the European Parliament and of the Council of 20 December 2006 establishing the statistical classification of economic activities NACE Revision 2 and amending Council Regulation (EEC) No 3037/90 as well as certain EC regulations on specific statistical domains⁸ has been applied in the production of short-term statistics. The breakdown by end use of product for industrial producer prices and industrial production is the harmonised sub-division of industry excluding construction (NACE Revision 2, sections B to E) into Main Industrial Groupings (MIGs) as defined by Commission Regulation (EC) No 656/2007 of 14 June 2007⁹. Industrial producer prices reflect the ex-factory gate prices of producers. They include indirect taxes except VAT and other deductible taxes. Industrial production reflects the value added of the industries concerned.

The two non-energy commodity price indices shown in Table 3 in Section 5.1 are compiled with the same commodity coverage but using two different weighting schemes. One is based on the commodity imports of the euro area (columns 2-4), and the other (columns 5-7) on estimated euro area domestic demand, or "use", taking into account information on imports, exports and the domestic production of each commodity (ignoring, for the sake of simplicity, inventories, which are assumed to be relatively stable over the observed period). The import-weighted commodity price index is appropriate for analysing external developments, while the use-weighted index is suitable for international commodity price pressures on euro area inflation. The use-weighted commodity price indices are experimental data. For more details as regards the compilation of the ECB commodity price indices, see Box 1 in the December 2008 issue of the ECB's Monthly Bulletin.

The labour cost indices (Table 5 in Section 5.1) measure the changes in labour costs per hour worked in industry (including construction) and market services. Their methodology is laid down in Regulation (EC) No 450/2003 of the European Parliament and of the Council of 27 February 2003 concerning the labour cost index¹⁰ and in the implementing Commission Regulation (EC) No 1216/2003 of 7 July 2003¹¹. A breakdown of the labour cost indices for the euro area is available by labour cost component (wages and salaries, and employers' social contributions plus employment-related taxes paid by the employer less subsidies received by the employer) and by economic activity. The ECB calculates the indicator of negotiated wages (memo item in Table 5 of Section 5.1) on the basis of non-harmonised, national-definition data.

Unit labour cost components (Table 4 in Section 5.1), GDP and its components (Tables 1 and 2 in Section 5.2), GDP deflators (Table 3 in Section 5.1) and employment statistics (Table 1 in Section 5.3) are derived from the ESA 2010¹² quarterly national accounts. In September 2014 the updated ESA 2010 Regulation

⁷ OJ L 162, 5.6.1998, p. 1.

⁸ OJ L 393, 30.12.2006, p. 1.

⁹ OJ L 155, 15.6.2007, p. 3.

¹⁰ OJ L 69, 13.3.2003, p. 1.

¹¹ OJ L 169, 8.7.2003, p. 37.

¹² OJ L 174, 26.6.2013, p. 1.

replaced the ESA 95 and became compulsory in the Member States of the EU. As in the past, the new regulation sets out the methodology, common standards, definitions, classifications and accounting rules used for compiling national accounts and tables in the EU as well as the data transmission programme setting out the time limits by which Member States have to make their data available. The ESA 2010 also employs concepts related to other statistical classifications, e.g. NACE Revision 2. The publication of euro area national accounts data applying this new classification began in November 2014.

Indices for turnover in industry and for retail trade (Table 3 in Section 5.2) measure the turnover, including all duties and taxes (with the exception of VAT), invoiced during the reference period. Retail trade turnover covers all retail trade (excluding sales of motor vehicles and motorcycles), including automotive fuel. New passenger car registrations cover registrations of both private and commercial passenger cars.

Qualitative business and consumer survey data (Table 5 in Section 5.2) draw on the European Commission Business and Consumer Surveys.

Unemployment rates (Table 4 in Section 5.3) conform to International Labour Organization guidelines. They refer to persons actively seeking work as a share of the labour force, using harmonised criteria and definitions. The labour force estimates underlying the monthly unemployment rate are different from the sum of the employment and unemployment levels published in Section 5.3.

Government finance

Sections 6.1 to 6.5 show the general government fiscal position in the euro area. The data are mainly consolidated and are based on the ESA 2010 methodology.

The annual euro area aggregates in Sections 6.1 to 6.3 are compiled by the ECB on the basis of statistical reporting requirements laid down in the ECB Guideline of 25 July 2013 on government finance statistics (ECB/2013/23)¹³. Harmonised data provided by the NCBs are updated on a regular basis.

The quarterly euro area aggregates and national data on government deficit/surplus and government debt in Section 6 are provided by Eurostat and may not be fully consistent with the annual data, for instance owing to different data cut-off dates or more frequent revisions.

The monthly euro area aggregates in Section 6.4 are compiled by the ECB on the basis of security-by-security information from the ESCB's Centralised Securities Database (CSDB)¹⁴.

Individual euro area country data in Section 6.5 are reported on the basis of Eurostat data (for government deficit/surplus and government debt) and CSDB data (for debt service and average nominal yields). The annual figures presented in Section 6.5 on government deficit/surplus and government debt are reported to the European

¹³ OJ L 2, 7.1.2014, pp. 12-33.

Commission under Commission Regulation (EU) No 220/2014 of 7 March 2014 amending Council Regulation (EC) No 479/2009 as regards references to the European system of national and regional accounts in the European Union.

External transactions and positions

On 9 December 2011 the ECB Guideline on the statistical reporting requirements of the European Central Bank in the field of external statistics (ECB/2011/23)¹⁵ was adopted by the Governing Council of the ECB. This legal act lays down the ECB's reporting requirements in the field of external statistics, in accordance with the sixth edition of the IMF's Balance of Payments and International Investment Position Manual (BPM6).

The euro area balance of payments (b.o.p.) and international investment position (i.i.p.) are compiled by the ECB on the basis of the information provided by euro area national central banks. The euro area aggregates are based on transactions and positions vis-à-vis non-euro area residents, treating the euro area as a single economic entity. Recent monthly figures should be regarded as provisional. Data are revised when figures for the following month and/or the detailed quarterly b.o.p. are published. Earlier data are revised periodically (generally in April and October) as a result of revisions to the underlying data sources and/or methodological changes in the compilation of the source data. Additional information on concepts, definitions and revision practices can be found in the "B.o.p. and i.i.p. book" available on the ECB's website under:

<http://www.ecb.europa.eu/pub/pdf/other/eubopintiinvposstmeth201611.en.pdf>.

The sign conventions for the b.o.p. current and capital accounts (tables in Sections 7.1, 7.2 and 7.4), give a plus sign for credit and debit transactions as well as surpluses; a negative sign denotes a deficit. As regards the b.o.p. financial account (tables in Sections 7.1, 7.3 and 7.4), a plus sign represents a net increase, and a minus sign a net decrease, in assets or liabilities. The i.i.p. is valued at current market prices, with the exception of direct investment, where book values are generally used for unquoted shares, and other investment (e.g. loans and deposits).

Table 1 in Section 7.2 also contains seasonally adjusted data for the current account. Where appropriate, the adjustment also covers working day, leap year and/or Easter-related effects. Table 4 in Section 7.2 and Table 10 in Section 7.3 present a breakdown of the euro area b.o.p. and i.i.p. vis-à-vis major partner countries, both individually and as a group, distinguishing between EU Member States outside the euro area and countries or areas outside the European Union. The breakdown also shows transactions and positions vis-à-vis EU institutions and international organisations (which, with the exception of the ECB and the ESM, are considered to be resident outside the euro area for statistical purposes, regardless of their physical location) as well as offshore centres. The breakdown does not cover transactions or positions in portfolio investment liabilities, financial derivatives or international reserves.

¹⁵ OJ L 65, 3.3.2012, p. 1.

Table 1 in Section 7.3 summarises the i.i.p. and financial transactions in the euro area b.o.p. In Table 2, columns 6 and 12 refer respectively to direct investment by resident units abroad and direct investment by non-resident units in the euro area (the so-called "directional principle"). These direct investment concepts are from the previous edition of the IMF's Balance of Payments and International Investment Position Manual (BPM5) and have been included to bridge the gap between the concepts in the two manuals.

In Table 7 in Section 7.3, the breakdown into "currency and deposits" and "loans" is based on the sector of the non-resident counterparty, i.e. assets vis-à-vis non-resident banks are classified as deposits, whereas assets vis-à-vis other non-resident sectors are classified as loans. This breakdown follows the distinction made in other statistics, such as the MFI consolidated balance sheet, and conforms to the BPM6.

The outstanding amounts for the Eurosystem's international reserves and related assets and liabilities are shown in Table 9 of Section 7.3. These figures are not fully comparable with those in the Eurosystem's weekly financial statement owing to differences in coverage and valuation. The data in Table 9 are in line with the recommendations included in the IMF's template guidelines on international reserves and foreign currency liquidity available at

<http://www.imf.org/external/np/sta/ir/IRProcessWeb/pdf/guide2013.pdf>. By definition, the assets included in the Eurosystem's international reserves take account of the changing composition of the euro area. Before countries join the euro area, the assets of their national central banks are included in portfolio investment (in the case of securities) or other investment (in the case of other assets). Changes in the gold holdings of the Eurosystem (column 3) are due to transactions in gold within the terms of the Central Bank Gold Agreement of 26 September 1999, which was updated on 27 September 2014. More information on the statistical treatment of the Eurosystem's international reserves can be found in a publication entitled "Statistical treatment of the Eurosystem's international reserves" (October 2000) available on the ECB's website under <http://www.ecb.europa.eu/pub/pdf/other/statintreservesen.pdf>. The website also contains more comprehensive data in accordance with the template on international reserves and foreign currency liquidity.

The euro area's gross external debt statistics in Table 11 of Section 7.3 represent outstanding actual (rather than contingent) liabilities vis-à-vis non-euro area residents that require the payment of principal and/or interest by the debtor at one or more points in the future. Table 11 shows a breakdown of gross external debt by instrument and institutional sector, while net external debt (i.e. gross external debt net of external debt assets) is shown in Table 13.

Section 7.4 contains a monetary presentation of the euro area balance of payments, showing the transactions by non-MFIs that mirror the net external transactions by MFIs. Included in the transactions by non-MFIs are b.o.p. transactions for which a sectoral breakdown is not available. These relate to the current and capital accounts (column 4) and financial derivatives (column 13). The net external transactions by MFIs include, in addition to those transactions included in monetary statistics, changes in non-resident holdings of equity and long term debt securities issued by euro area MFIs (column 3). An occasional paper on the monetary presentation of the

euro area balance of payments is available in the "Statistics" section of the ECB's website under "Balance of payments and international investment positions" (<https://www.ecb.europa.eu/pub/pdf/scpops/ecb.op238~7676fa5c40.en.pdf?4ad6966b34516bd6afcb9b10abe91c8>).

Section 7.5 shows Eurostat data on euro area external trade in goods. Value data and volume indices are seasonally and working day-adjusted. The breakdown by product group in columns 4 to 6 and 9 to 11 of Table 1 in Section 7.5 is in line with the classification contained in the Broad Economic Categories and corresponds to the basic classes of goods in the System of National Accounts. Manufactured goods (columns 7 and 12) and oil (column 13) are in line with the Standard International Trade Classification Revision 4 definition. The geographical breakdown (Table 3 in Section 7.5) shows major trading partners both individually and in regional groups. China excludes Hong Kong. On account of differences in definitions, classification, coverage and time of recording, external trade data, in particular for imports, are not fully comparable with the goods item in the b.o.p. statistics (Sections 7.1 and 7.2). Part of the difference arises from the inclusion of insurance and freight services in the recording of imported goods in external trade data. For more details see page 22 of "Euro area balance of payments and international investment position statistics - 2015 quality report" (April 2016) available on the ECB's website under <http://www.ecb.europa.eu/pub/pdf/other/euroareabalanceofpaymentsiipstatistics201604en.pdf>.

Industrial import prices and industrial producer export prices (or industrial output prices for the non-domestic market) shown in Table 2 in Section 7.5 were introduced by Regulation (EC) No 1158/2005 of the European Parliament and of the Council of 6 July 2005 amending Council Regulation (EC) No 1165/98, which is the principal legal basis for short-term statistics. The industrial import price index covers industrial products imported from outside the euro area cited in sections B to E of the Statistical Classification of Products by Activity in the European Economic Community (CPA) and all institutional import sectors except households, governments and non-profit institutions. It reflects the cost, insurance and freight price excluding import duties and taxes, and refers to actual transactions in euro recorded at the point when ownership of the goods is transferred. The industrial producer export prices cover all industrial products exported directly by euro area producers to the extra-euro area market cited in sections B to E of NACE Revision 2. Exports from wholesalers and re-exports are not covered. The indices reflect the free on board price expressed in euro and calculated at the euro area frontier, including any indirect taxes except VAT and other deductible taxes. Industrial import prices and industrial producer export prices are available by Main Industrial Grouping as defined by Commission Regulation (EC) No 656/2007 of 14 June 2007. For more details, see Box 11 in the December 2008 issue of the ECB's Monthly Bulletin available on the ECB's website under <http://www.ecb.europa.eu/pub/pdf/mobu/mb200812en.pdf>.

Exchange rates

Section 8.1 shows nominal and real effective exchange rate (EER) indices for the euro, which are calculated by the ECB on the basis of weighted averages of the

euro's bilateral exchange rates against the currencies of selected trading partners of the euro area. A positive change denotes an appreciation of the euro. Weights are based on trade in manufactured goods with those trading partners in the periods 1995-97, 1998-2000, 2001-03, 2004-06, 2007-09 and 2010-12 and are calculated to account for "third-market effects". The EER indices are obtained by chain-linking the indicators on the basis of each of these six sets of trade weights at the end of each three-year period. The base period of the resulting EER index is the first quarter of 1999. The EER-19 group of trading partners is composed of the non-euro area EU Member States plus Australia, Canada, China, Hong Kong, Japan, Norway, Singapore, South Korea, Switzerland and the United States. The EER-18 group excludes Croatia. The EER-38 group comprises the EER-19 plus the following: Algeria, Argentina¹⁶, Brazil, Chile, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, the Philippines, Russia, South Africa, Taiwan, Thailand, Turkey and Venezuela. Real EERs are calculated using consumer price indices (CPIs), producer price indices (PPIs), gross domestic product deflators and unit labour costs, both for the manufacturing sector (ULCM) and for the total economy (ULCT). ULCM-deflated EERs are available only for the EER-18.

For more detailed information on the calculation of the EERs, see the relevant methodological note available on the ECB's website under <http://sdw.ecb.europa.eu/reports.do?node=100000232> and ECB Occasional Paper No 134 ("Revisiting the effective exchange rates of the euro" by Martin Schmitz, Maarten De Clercq, Michael Fidora, Bernadette Lauro and Cristina Pinheiro, June 2012), which is available on the ECB's website under <http://www.ecb.europa.eu/pub/pdf/scpops/ecbocp134.pdf>.

The bilateral exchange rates shown in Section 8.2 are monthly averages of those published daily by the ECB as reference rates for these currencies. The last rate published for the Icelandic krona is 290.0 per euro, as at 3 December 2008.

Developments outside the euro area

Statistics on other EU Member States (Section 9.1) follow the same principles as data relating to the euro area. However, data shown in this table on current and capital accounts and gross external debt follow the respective national concept and do not include special-purpose vehicles. The data for the United States and Japan contained in Section 9.2 are obtained from national sources.

¹⁶ Data for Argentina are currently not available due to the state of emergency in the national statistical system declared by the government of Argentina on 07 January 2016. As a consequence, Argentina is not included in the calculation of the EER-38 CPI deflated series from February 2016. The policy regarding the inclusion of Argentina will be reconsidered in the future depending on further developments.

Brexit

On 31 January 2020 the United Kingdom left the European Union, taking the number of EU countries to 27. Unless otherwise indicated, all time series including observations for February 2020, the first quarter of 2020 or the full year 2020 relate to the EU excluding the United Kingdom for the whole time series.

Note to Tables 5.1

Chapter 5 – prices, output, demand and labour markets

Section 5.1 – HICP, other prices and costs

Table 5.1.1 Harmonised Index of Consumer Prices

In October 1998 the Governing Council of the ECB agreed on the main elements of the single monetary policy. In this context, the Governing Council decided that price stability would be defined on the basis of the Harmonised Index of Consumer Prices (HICP) for the euro area. In addition, as clarified in May 2003, the Governing Council adopted a quantitative definition of price stability defined as a year-on-year increase in the HICP for the euro area of *"below but close to 2.0"*.¹ In addition, the Governing Council stated that *"price stability was to be maintained over the medium term"*.

1. Development of HICP methodology since 1992

Article 1 of the Protocol on the convergence criteria referred to in Article 121 of the Treaty establishing the European Community requires price convergence to be measured by means of the consumer price index *on a comparable basis*. Given the differences between national consumer price indices (CPIs), in 1993 the European Commission (Eurostat) initiated the development of the HICP methodology in cooperation with all the EU national statistical institutes responsible for the production of CPIs at the national level.

In October 1995 the EU Council Regulation on HICPs (<http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:31995R2494:EN:HTML>) was adopted. It provides the framework for harmonisation and states that *"HICPs shall be considered to be comparable if they reflect only differences in price changes or consumption patterns between countries"*.

The first monthly HICP data were released for January 1997 with backdata to January 1996 (estimates for 1995 were also made available). Since then, several more detailed harmonisation measures have been developed and implemented.

2. The HICP for the euro area

Since May 1998 the Monetary Union Index of Consumer Prices (MUICP) has been published each month for the Member States participating in the Monetary Union.

¹ See the ECB's press release of 8 May 2003 and the May 2003 issue of the ECB's Monthly Bulletin.

The MUICP is the weighted arithmetic average of the HICPs for the euro area countries. The euro area HICP covers the Member States which have adopted the euro in the time period to which the data relate. When a country joins the euro area, the national HICP for that country is included in the euro area HICP using a chain index formula. The MUICP is computed as an annually chain-linked index with country weights changing each year. The weight of each country is its share of private domestic consumption expenditure in the euro area (the source for these shares is the National Accounts). As National Accounts results become available with a time-lag, the weights relate to the penultimate year. Country weights for the years 1995 to 1998 are converted into euro using the fixed euro conversion rates applied from January 1999. Eurostat publishes the most recent country weights with the release of the January data every year.

The HICPs are published according to the COICOP/HICP classification (classification of individual consumption by purpose adapted to the needs of HICPs). The European Commission (Eurostat) publishes the HICPs for 12 main Divisions, 40 Groups and 103 Classes. Additional aggregates compiled from COICOP/HICP sub-indices, including the components shown in Table 5.1.1 of the ECB's Statistics Bulletin, are also available.

Since end-2001, the European Commission (Eurostat) has published flash estimates of the HICP, normally at the end of the reference month. These are derived from first national HICP results for Germany, Spain and Italy, as well as other countries, including confidential and provisional data and information on energy price developments in the euro area countries.

HICPs are generally revisable. The HICP of the current month is provisional and may change when the following month's data are published.

As of January 2006, the MUICP and its components are compiled from unrounded national index levels and are published to two decimal places. The annual rates of change are calculated from the published indices and published to one decimal place.

Some of the HICP data shown in Table 5.1.1 are seasonally adjusted by the ECB using X-13 and JDemetra+. The overall HICP is seasonally adjusted indirectly by aggregating the following seasonally adjusted components of the euro area total: processed food, unprocessed food, industrial goods excluding energy, and services. The energy component is not seasonally adjusted since identifiable seasonality is not present. Where applicable and appropriate, euro area HICPs are also adjusted for calendar effects. For additional information, see the box entitled "Harmonised Index of Consumer Prices - Easter effects and improved seasonal adjustment", Economic Bulletin, Issue 3, ECB, 2016. Seasonal factors are revised at annual intervals or more frequently if required. The methodology is described in detail in the document entitled "Seasonal adjustment of monetary aggregates and Consumer Price Indices (HICP) for the euro area" (<http://www.ecb.europa.eu/pub/pdf/other/sama0008en.pdf>), which is available on this website. Eurostat publishes all HICPs for the Member States, the euro area and the European Union approximately 16 days after the end of the reference month.

All data shown in Table 5.1.1 are available in CSV files that can be downloaded from this website (<http://www.ecb.europa.eu/stats/prices/hicp/html/index.en.html>). HICP

data for the euro area and for EU countries can be accessed using the ECB's interactive inflation dashboard (<http://www.ecb.europa.eu/stats/prices/hicp/html/inflation.en.html>). Further information on data sources, publications and methodology can also be obtained from Eurostat's dedicated HICP website (<http://ec.europa.eu/eurostat/web/hicp/overview>).

3. Stages in harmonising the HICP methodology

The harmonisation of consumer price indices is based mainly on a set of EU legislative acts, as well as on commonly developed recommendations and guidelines. An overview of the main measures which have been agreed can be obtained via the following links:

- <http://ec.europa.eu/eurostat/web/hicp/legislation>
- <http://ec.europa.eu/eurostat/documents/3859598/5926625/KS-RA-13-017-EN.PDF/59eb2c1c-da1f-472c-b191-3d0c76521f9b?version=1.0>

Further harmonisation measures currently being discussed concern, in particular, the harmonisation of quality adjustment procedures and the coverage of owner-occupied housing expenditure in the HICP.

Table 5.1.2 industry, construction and property prices

The **industrial producer price indices (for total industry excluding construction)** are published by the European Commission (Eurostat). They measure the changes in ex-factory selling prices and cover all sales on the domestic markets. This implies that internal euro area cross-border trade is excluded. For periods before 1999, the results are based on indices in national currencies. The euro area aggregate is a weighted arithmetic average of national indices. Country weights are derived from domestic turnover in 2005. Industrial producer prices are covered by the EU Council Regulation concerning short-term statistics and related implementing regulations. Price indices include specific taxes excluding VAT.

As a general rule, euro area aggregates are compiled by Eurostat if at least 60% of the weight for a given variable and a given activity is available, although in practice the country coverage is much higher for the producer price indices. Any country statistics that are unavailable are estimated. Producer price indices are not seasonally adjusted.

The data shown in the Statistics Bulletin are compiled according to the international classification NACE Rev. 2 (columns 1 and 2: sections B to E; column 3: section C). The totals in columns 4 and 7 are compiled from the *Main Industrial Groupings* (columns 5, 6, 8 and 9, and columns 8 and 9, respectively), which are derived from the detailed results for NACE Rev. 2 divisions and groups. As regards the composition of the aggregates, it should be noted that the manufacture of computers and peripheral equipment, together with the manufacture of motor vehicles, are fully included in *capital goods* and not in *durable consumer goods*. The series for *total industry excluding construction and energy* differs in its coverage of activities from the series for *manufacturing*, as it excludes the manufacture of coke and refined petroleum products, but does include non-energy mining and quarrying activities.

Eurostat currently publishes the data approximately five weeks after the end of the reference month.

The **input price index for construction** (column 11) is published by the European Commission (Eurostat) and refers to changes in prices of labour and materials used for constructing residential buildings. The euro area aggregate is a weighted arithmetic average of national indices. The data are not seasonally adjusted.

Statistics on output prices in *construction* are not harmonised across the euro area. Differences include the definition of the prices measured, the types of buildings covered and the frequency of the data. Construction price statistics are covered by the EU Council Regulation concerning short-term statistics.

All the previously mentioned data are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/hicp/html/index.en.html>). More detailed data and national results can be obtained from Eurostat's website (http://ec.europa.eu/eurostat/statistics-explained/index.php/Industrial_producer_price_index_overview), where further information on data and data sources can also be found.

The euro area **residential property price indicator** and **experimental indicator of commercial property prices** are compiled by the ECB as an aggregation of

heterogeneous national indicators of varying quality using GDP shares as weights.

The underlying national **residential property price data** differ in terms of:

- *geographical coverage*, with some referring only to property transactions in large cities or selected regions within the country concerned;
- *property-type coverage*, with some excluding newly constructed dwellings or other types of dwelling;
- the *types of price observation collected*, e.g. transaction prices obtained from land registries/notaries, agreed prices quoted in mortgage loan applications, prices advertised by real estate agents and values as assessed by professional property values;
- *the time at which a price observation enters the index*, reflecting the variety of data sources and the long time period over which a house transaction may be concluded.
- *quality adjustment*, i.e. how the observed prices are adjusted for changes in the quality or composition of the observed properties.

The impact of these methodological differences on the reliability of the euro area residential property price indicator is difficult to judge. Given the influence of local factors in property markets, national indicators which focus on developments in a limited sub-set of the whole market may give misleading results. The lack of appropriate quality-adjustment methods can have both short-term effects, owing to changes in the types of property transacted from one period to the next, and long-term effects, due to gradual improvements in the quality of the housing stock.

The methodology and caveats underlying the experimental index of **commercial property prices** is described in full in an expanded box in the ECB Monthly Bulletin of February 2014 (see <http://www.ecb.europa.eu/pub/pdf/mobu/mb201402en.pdf> , page 54). The preferred data are provided by national statistical institutes or other sources that have been endorsed by the respective national central bank. Where these are not available, a commercial data source is used by the ECB to compile euro area and EU aggregates. Countries that are not covered by either national data sources or the commercial dataset are assumed to show the same development as the GDP-weighted average of the countries for which indicators of commercial property prices have been compiled.

Table 5.1.3 commodity prices and deflators of gross domestic product

Data on **oil prices** refer to Brent crude oil spot prices. The prices are published by Bloomberg and are shown in euro per barrel (ECU per barrel for periods before 1999).

The **import-weighted and use-weighted non-energy commodity price indices** are calculated by the ECB. They both have the same commodity coverage, use the same set of underlying single commodity price series – 34 commodities in total distributed among 18 food categories and 16 non-food categories, agricultural raw materials and metals – but use different weighting structures. The single commodity price series are downloaded from Bloomberg and Datastream and are converted into US dollars and into euro (into ECU for periods before 1999).

The weights of the import-weighted index currently refer to the average raw material imports of euro area countries from countries outside the euro area for the period 2004-2006. Data are taken from Eurostat's external trade statistics (COMEXT database). This import-weighted index is designed to assess price developments in imported commodities and to assist in the forecasting of external trade (volumes and prices).

The weights of the use-weighted index refer to the estimated value of euro area domestic demand, or "use", taking into account information on imports, exports and the domestic production of each commodity (for the sake of simplicity, as well as owing to the lack of appropriate and comprehensive data sources, inventories are assumed to remain stable over the observed period) and they also refer to the average of the period 2004-2006. This weighting scheme is more commensurate with the consumption patterns of globally traded commodities in the euro area and provides information about pressures on consumer prices stemming from global commodity price movements (assuming that the prices of domestically produced commodities move in parallel with those on the world market). Several data sources are used to calculate the weights: Eurostat's agricultural statistics, external trade statistics (COMEXT) and by-product manufacturing statistics (PRODCOM); and the statistics compiled by the Food and Agriculture Organisation of the United Nations (FAOSTAT).

The overall import-weighted index and use-weighted index and their sub-indices are calculated by applying the fixed-weighted Laspeyres formula. The long time series are derived by linking the old price indices (using weights from 1999 to 2001) with the new ones in December 2002; the index base is 2000=100. Indices based on commodity prices in US dollars and euro are calculated. The results are not seasonally adjusted.

The euro area deflators of GDP are calculated by the ECB. From 1999 onwards, developments in the deflators have been identical to those of the ratio of data in current prices to chain-linked volume data expressed in ECU/EUR, as shown in Table 5.2.1 of the Statistics Bulletin. For periods before 1999, they differ because the implicit euro area deflators derived from data expressed in ECU have been corrected by a coefficient. In this way any exchange rate effects are removed from the deflators because otherwise they can distort the measure of domestic price developments.

The purpose of this correction is to obtain what would have been the aggregated euro area deflator developments had no exchange rate movements been observed between the national currencies used before the introduction of the euro.

Since euro area data in current prices become available later than the data in volumes, the deflators may lag information on GDP growth by a quarter (*cf.* Table 5.2.1).

The deflators of *exports* and *imports* cover goods and services, and include internal cross-border trade in the euro area.

All the previously mentioned data are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/hicp/html/index.en.html>).

References

[Regulation \(EU\) No 549/2013 of the European Parliament and of the Council of 21 May 2013](#) on the European system of national and regional accounts in the European Union, Official Journal of the European Union, L174/1, 26 June 2013, p. 1.

Table 5.1.4 unit labour costs, compensation per employee and labour productivity

The **unit labour cost and its components** are calculated by the ECB based on published ESA 2010 national accounts data for GDP and compensation of employees and on the ECB estimates of employment shown in Table 5.3.1.

The **unit labour cost for the whole economy** is defined as compensation per employee divided by real gross domestic product per employed person.

Compensation per employee in the whole economy is defined as wages and salaries plus the employers' social security contributions per person receiving compensation.

Labour productivity in the whole economy is defined as real gross domestic product per employed person.

All the previously mentioned data are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/hicp/html/index.en.html>).

Table 5.1.5 hourly labour costs

The **labour cost indices** measure the changes in labour costs per hour worked in industry (including construction) and market services. The methodology (definitions, coverage, breakdowns, etc.) of these quarterly indicators is laid down in two EC regulations (see below). Labour costs include gross wages and salaries (in cash and kind, including bonuses) and other labour costs (employers' social contributions plus employment-related taxes paid by the employer less subsidies received by the employer). Apart from the overall index, indices are available to show the breakdown by labour cost component (wages and salaries, other labour costs) and by economic activity.

The labour cost indices for the euro area are compiled and published by Eurostat on the basis of data from the national statistical institutes, delivered within 70 days of the end of the reference period. Euro area and EU aggregates are obtained as weighted averages of the national data, using compensation weights from the year 2008. Data are adjusted for the variations in the number of working days. Data are also available in seasonally and working day-adjusted formats.

The **index of negotiated wages** is a measure of the outcome of collective bargaining in terms of basic pay or salary (i.e. excluding bonuses) within the euro area. Changes in the index refer to the implied average change of a monthly wage or salary. The underlying data used to calculate the euro area aggregate are non-harmonised national indicators.

All the previously mentioned data are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/hicp/html/index.en.html>). For the hourly labour cost index, more detailed data and national results are available from Eurostat's NewCronos data bank. Recent data can also be obtained from Eurostat's website (<http://ec.europa.eu/eurostat/web/labour-market/labour-costs/main-tables>), where further information on data and data sources can also be found.

Note to Tables 5.2

Chapter 5 – prices, output, demand and labour markets

Section 5.2 – output and demand

Table 5.2.1 GDP and expenditure components and Table 5.2.2 value added by economic activity

From the beginning of September 2014, Member States' national accounts are compiled according to the harmonised accounting definitions and methodology adopted in the ESA 2010 Regulation, which also includes a set of tables specifying which data should be provided, and the timetable for this. On the basis of the available quarterly and annual information in the Member States, the European Commission (Eurostat) estimates euro area national account aggregates.

For each quarter, Eurostat publishes two GDP flash estimates, a subsequent full release of quarterly national accounts (QNA) followed by a final database update. The preliminary¹ flash estimate for euro area quarterly GDP growth (seasonally and working day-adjusted and at previous year's prices) is published about 30 days after the end of the reference quarter. It is based on national contributions some of which are published (Austria, Belgium, France, Italy, Latvia, Lithuania and Spain) while others are provided on a confidential basis to Eurostat only for the compilation of the euro area GDP growth. A more complete and incorporating publically available data GDP flash estimate, or the first release, is subsequently published within 45 days of the end of the reference quarter. It is usually based on estimates provided by most of the euro area countries (Belgium, Germany, Estonia, Greece, Spain, France, Italy, Cyprus, Latvia, Lithuania, the Netherlands, Austria, Portugal, Slovakia and Finland), together with estimates for missing countries. The second or full release is published around 68 days after the end of the reference quarter (the legal requirement for data reporting by the Member States is 60 days after the end of the reference quarter). It includes GDP by main production, expenditure and income components. In addition, it also contains the goods and services breakdown for exports and imports and the product (asset) breakdown for gross fixed capital formation. Finally, Eurostat publishes a third GDP release at around t+100 days, which is a database update, i.e. no press release is published.² The second and third GDP releases comprise of data at current prices, previous year's prices and chain-linked volumes.

Data are available as unadjusted, seasonally adjusted and seasonally and working-day adjusted. Some national data are however only seasonally adjusted,

¹ The preliminary GDP flash estimate was introduced by Eurostat on 29 April 2016 after the positive outcome of two-year test estimations and a dedicated Task Force group. More information is available at Eurostat's website (<http://ec.europa.eu/eurostat/web/national-accounts/methodology/european-accounts/estimation-european-main-aggregates>).

² The third quarterly release at t+100 days after the end of the reference period was reintroduced in April 2017, after being previously discontinued in September 2014. It has a 100% country coverage and full detail breakdown, incorporating revisions or new national data published after the second GDP release.

whereas most data are both seasonally and working-day adjusted. Consequently, seasonally adjusted quarterly euro area aggregates are a mix of seasonally adjusted data, both in terms of the working-day correction and the seasonal adjustment methods used.

The series are expressed in euro (ECU up to end-1998). However, given that the composition of the ECU does not coincide with the former currencies of the countries which have adopted the single currency, pre-1999 amounts converted from the participating currencies into ECU at current ECU exchange rates are affected by movements in the currencies of EU Member States which have not adopted the euro. The backdata for Table 5.2.1 are therefore not appropriate as a means of deriving implicit deflators for periods before 1999 (see Table 5.1.5 for the ECB calculations of implicit deflators).

Data on exports and imports of goods and services include cross-border trade in the euro area. Moreover, euro area exports, imports and the trade balance are affected by asymmetries in the recording of external trade in the European Union. Private consumption in the euro area covers the final consumption of households and non-profit institutions serving households (NPISHs) residing in the euro area. This final consumption may take place inside or outside the euro area. Changes in inventories include acquisitions and disposals of valuables.

Gross value added data are broken down into 10 main aggregates (A*10) of activity. Total value added plus the balance of taxes less subsidies on products results in GDP at market prices.

Eurostat's estimation procedure ensures consistency between total GDP and its components. However, while euro area GDP in current prices is the sum of the respective GDP components, this is not the case for euro area GDP volumes. Due to the use of annually chain linked volume measures, both the results for euro area volumes using the year 2015 as a reference year³, as well as for growth rates there may be differences between aggregates and components for years other than the years 2015 and 2016.

All data shown in Tables 5.2.1 and 5.2.2 are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/accounts/html/index.en.html>). More detailed data and national results are available from Eurostat's database. A small sub- set of the data can also be obtained from Eurostat's website (<http://ec.europa.eu/eurostat/web/national-accounts/data/main-tables>) which also provides further information on data and data sources.

Relevant methodological information about the transition from ESA 95 to ESA 2010 is available at the Eurostat's website (<http://ec.europa.eu/eurostat/web/esa-2010> and http://ec.europa.eu/eurostat/c/portal/layout?p_l_id=737991&p_v_l_s_g_id=0).

³ As of October 2019, a common reference year, i.e. year 2015, for the European aggregates and EU countries is applied. The previous reference year was 2010.

Table 5.2.3 industrial production

Industrial production in the euro area is calculated and published by the European Commission (Eurostat). As a general rule, Eurostat compiles euro area aggregates if at least 60% of the weight for a given variable and a given activity is available. Any country data that are unavailable at the current end of the series are replaced by forecasts. All national results are adjusted for variations in the number of working days and seasonally adjusted. These series are aggregated by Eurostat to compile the euro area index (indirect approach).

The index of production measures changes in the volume of the gross value added that is generated by industry. It is covered by the EU Council Regulation concerning short-term statistics and related implementing regulations.

Monthly euro area statistics on production in *industry including construction* (column 1) are based on results for twelve euro area countries; monthly euro area statistics on production in *construction* (column 12) exclude Estonia, Ireland, Greece, Cyprus, Latvia, Lithuania and Malta.

Monthly euro area statistics on production in *industry excluding construction* are available from all euro area countries. The euro area aggregates are weighted arithmetic averages of national indices. Country weights are derived from value added at factor cost in 2010.

The data shown in the ECB's Statistics Bulletin follow the international classification NACE Rev. 2. Both the *Main Industrial Groupings* (columns 6 to 11, excluding 8) and the corresponding totals (columns 5 and 8) are compiled from detailed results for NACE Rev. 2 divisions and groups. The series for *total industry excluding construction and energy* differs in terms of coverage of activities from the series for *manufacturing*, as it excludes the manufacture of coke and refined petroleum products, but does include non-energy mining and quarrying activities.

For *industry excluding construction*, Eurostat publishes results for the euro area at around 42 days after the end of the reporting month. Monthly results for the *construction* sector are available approximately 48 days after the reference period.

All data shown in Table 5.2.3 are available in CSV files that can be downloaded from the "Statistics" section of this website

(<http://www.ecb.europa.eu/stats/prices/accounts/html/index.en.html>). More detailed data and national results are available from Eurostat's data bank available at:

Table 5.2.4 industrial new orders and turnover, retail sales and passenger car registrations

ECB indicator on euro area industrial new orders

The industrial new orders index measures changes in the orders received from domestic and non-domestic customers by the manufacturing industries (NACE Rev. 2 C) that tend to work on the basis of orders, namely textile (NACE 13 and 14), paper and paper products (17), chemical (20), pharmaceutical products (21), metal and capital good industries (24 to 30). Orders arriving in one reference period but cancelled in another are not subtracted; new order data are calculated on the basis of current prices. Eurostat discontinued the provision of industrial new orders statistics as of the reporting period of March 2012 and the ECB has developed a new monthly indicator on euro area industrial new orders, compiled from official national data and model-based estimates for those countries that no longer release new orders data. Historical values up to March 2012 are those released by Eurostat.⁴

Indices on industrial turnover cover turnover invoiced during the reference period, including all duties and taxes except VAT. Monthly results are available for all euro area countries.

Retail sales indices at constant prices measure the turnover of the retail trade industry in 2010 prices. Monthly statistics are available for all euro area countries. Eurostat publishes first estimates for the euro area approximately 33 days after the end of the reference period. Retail sales correspond to NACE Rev.2 Division 47, and exclude sales of motor vehicles and motorcycles as well as repairs of personal and household goods.

The EU Council Regulation concerning short-term statistics provides the legal framework for all of the indices listed above; all indices are calculated and published by the European Commission (Eurostat). Euro area series are computed as weighted averages of national series. National series are weighted by turnover in 2010. Euro area aggregates are calculated if there is at least 60% country coverage. Above this threshold, any country data that are unavailable at the current end of the series are replaced by forecasts. **New passenger car registrations** for the euro area are available in a timely fashion from the European Automobile Manufacturers' Association (ACEA). The data cover registrations of all new cars, including passenger cars used for commercial purposes. The data are seasonally adjusted by the ECB using X-12- REGARIMA.

All data shown in Table 5.2.4 are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/accounts/html/index.en.html>). More detailed data and national results are available from Eurostat's website at: <http://ec.europa.eu/eurostat/data/database> which also provides further information on data and data sources.

⁴ For a comprehensive description of the modelling framework and the test results, see de Bondt, G. J., Dieden, H.C., Muzikarova, S. and Vincze, I., "Introducing the ECB indicator on euro area industrial new orders", ECB Occasional Paper, No 149, ECB, June 2013 at: <http://www.ecb.europa.eu/pub/pdf/scpops/ecbocp149.pdf>.

References

See references for Table 5.2.3.

Table 5.2.5 business and consumer surveys

The European Commission's Business and Consumer Surveys are carried out by national institutions on behalf of the European Commission. Harmonised questionnaires consisting of a set of mainly qualitative questions are in most cases addressed at a monthly frequency to around 75,000 firms and 26,000 consumers in the euro area.

Euro area aggregates are based on results for all euro area countries (excluding Luxembourg in the retail trade and services survey and Ireland for all surveys except the consumer survey), using appropriate weights from national accounts sources. Survey results are generally presented as percentage balances, i.e. the difference between the percentages of positive and negative responses, and are seasonally adjusted by the European Commission. In general, initial results are published by the Directorate General for Economic and Financial Affairs (DG ECFIN) on the penultimate working day of the reporting month.

The **economic sentiment indicator** is composed of the industrial, services, consumer, construction and retail trade confidence indicators; the industrial confidence indicator has a weight of 40%, the services confidence indicator a weight of 30%, the consumer confidence indicator a weight of 20% and the two other indicators a weight of 5% each. Values of the economic sentiment indicator above (below) 100 indicate above-average (below-average) economic sentiment, calculated for the period 1990 to 2014.

The **industrial confidence indicator in manufacturing** is the arithmetic average of the responses (percentage balances) to the questions on the assessment of the following categories: order books, stocks of finished products (with an inverted sign) and production expectations.

Data on **capacity utilisation in manufacturing and for services** are collected in January, April, July and October, and are expressed as percentages of full capacity.

The consumer confidence indicator is the arithmetic average of the responses (percentage balances) to the questions on expected developments over the next 12 months in the financial situation of households, the general economic situation, unemployment and savings.

The **construction confidence indicator** is the arithmetic average of the responses (percentage balances) to the questions on the assessment of order books and on employment expectations.

The **retail trade confidence indicator** is the arithmetic average of the responses (percentage balances) to the questions on the present business situation, the assessment of stocks (with an inverted sign) and the expected business situation.

The **services confidence indicator** is the arithmetic average of the responses (percentage balances) to the questions on the assessment of the current business climate, the assessment of demand in recent months, and expected developments in demand in the months ahead.

Time series from the European Commission's Business and Consumer Surveys are also available at DG ECFIN's web site at: http://ec.europa.eu/economy_finance/db_indicators/surveys/time_series/index_en.htm

Note to Tables 5.3

Chapter 5 – prices, output, demand and labour markets

Section 5.3 – labour markets

Table 5.3.1 employment

Statistics on **employment** are published by the European Commission (Eurostat) and are based on national accounts data under the European System of Accounts 2010 (ESA 2010). A quarterly euro area estimate for total employment with a breakdown by employees and self-employed persons is published about 75 days after the reference quarter. Employment covers employees and the self-employed working in resident production units. The employment data shown are measured in number of persons in employment and the number of hours worked; other possible measures for employment are full-time equivalents and jobs.

Table 5.3.2 unemployment

The statistics on **unemployment** are published by the European Commission (Eurostat) and follow the guidelines of the International Labour Organization (ILO). Unemployed persons are defined as those aged 15 years and over who are without work, are available to start work within two weeks and have actively sought employment during the previous four weeks. It should be noted that this definition of unemployment can differ from those definitions used at the national level. Adult workers are defined as those 25 years old and over; those below 25 years of age are classified as youth workers.

The unemployment estimates are based on the results of the continuous European Community Labour Force Survey (LFS), which is currently being carried out in all euro area countries. Monthly estimates are then either obtained at a national level from the same source or are extrapolated from the comparable benchmark figures supplied in the LFS using national unemployment data, which are partly based on labour force surveys and partly on information from unemployment registers.

The **unemployment rate** is the number of unemployed people as a percentage of the civilian labour force (people living in collective households are excluded). The labour force is the total of the employed and the unemployed.

Seasonally adjusted results are compiled from seasonally adjusted country series where available. In some cases Member States provide trend series instead. The European Commission (Eurostat) generally publishes results on the last working day

of the month following the reference period, including estimates for missing country data.

All data shown in Tables 5.3.1 and 5.3.2 are available in CSV files that can be downloaded from the "Statistics" section of this website (<http://www.ecb.europa.eu/stats/prices/labour/html/index.en.html>). More detailed data and national results are available from Eurostat's NewCronos data bank on Eurostat's website (<http://ec.europa.eu/eurostat/web/lfs/data/database>), which also provides further information on data and data sources.

Note to Tables 8.1

Chapter 8 – exchange rates

Section 8.1 – effective exchange rates¹

1. The effective exchange rates (EERs) of the euro are weighted geometric averages of the bilateral exchange rates of the euro against the currencies of the euro area's main trading partners. A positive change in the index denotes a strengthening of the EER of the euro. The weights assigned to each trading partner combine information on imports and exports of manufactured goods between it and the euro area. The nominal EER of the euro is defined as:

$$(1.1) \text{NEER}^t = \prod_{i=1}^N (e_{i,euro}^t)^{w_i}$$

where N stands for the number of trading partners in the reference group, $e_{i,euro}^t$ is an index of the average exchange rate of the currency of trading partner i vis-à-vis the euro in period t , and w_i is the trade weight assigned to the currency of trading partner i .

2. Real EERs of the euro are calculated as weighted geometric averages of nominal bilateral exchange rates deflated using different relative price and cost measures (see below). The real EER of the euro is hence defined as:

$$(1.2) \text{REER}^t = \prod_{i=1}^N \left(\frac{d_{euro}^t e_{i,euro}^t}{d_i^t} \right)^{w_i}$$

where N stands for the number of trading partners in the reference group, $e_{i,euro}^t$ is an index of the average exchange rate of the currency of trading partner i vis-à-vis the euro in period t , d_i^t , d_{euro}^t are the deflators for the euro area and trading partner i , and w_i is the trade weight assigned to the currency of trading partner i .

Trade basis

3. The weights are based on bilateral data on trade in manufactured goods, as defined in Sections 5 to 8 of the Standard International Trade Classification (i.e. excluding agricultural products, raw material and energy products)², and trade in services (Total EBOPS Services) for the periods 1995-97, 1998-2000, 2001-03, 2004-06, 2007-09, 2010-12, 2013-15 and 2016-18. However, manufacturing-focused real effective exchange rates and harmonised competitiveness indicators, deflated by producer prices (PPI) or unit labour cost in the manufacturing sector (ULCM), rely on weights solely based on trade in manufactured goods.

¹ For additional information, see the "[Daily nominal effective exchange rate of the euro](#)" section of the ECB's website.

² These categories comprise chemicals and related products, manufactured goods classified chiefly by material, machinery and transport equipment, and miscellaneous manufactured articles.

Trading partners

4. The EERs are calculated for three groups of trading partners:

- EER-12: this group is composed of Australia, Canada, Denmark, Hong Kong, Japan, Norway, Singapore, South Korea, Sweden, Switzerland, the United Kingdom and the United States.
- EER-19: this group includes Bulgaria, China, Croatia, Czech Republic, Hungary, Poland and Romania in addition to the trading partners in the EER-12.
- EER-42: in addition to the trading partners in the EER-19, the EER-42 includes Algeria, Argentina, Brazil, Chile, Colombia, Iceland, India, Indonesia, Israel, Malaysia, Mexico, Morocco, New Zealand, Peru, the Philippines, Russia, Saudi Arabia, South Africa, Taiwan, Thailand, Turkey, Ukraine and the United Arab Emirates.

5. The selection is based on the importance of the trading partners for the euro area and on data availability, in particular the availability of high quality data on price and cost indicators for use in the calculation of the real EERs.

Weighting scheme

6. The EERs of the euro are calculated using trade weights that combine information on both exports and imports, excluding intra-euro area trade. Import weights are each trading partner's simple share in total euro area imports. Export weights, on the other hand, are double-weighted to account for "third-market effects". More specifically, they capture the effect of competition faced by euro area exporters in foreign markets not only from domestic producers but also from exporters from third countries.³ The overall weight of each partner country i is obtained as the weighted average of the export and import weights.⁴

Updating of trade weights

7. When the EERs of the euro were initially calculated in 1999, the first set of trade weights was based on data for the three-year period from 1995 to 1997. This weighting scheme remained in place until the first five-yearly update in 2004, when the weights for the period 1995-97 were recalculated taking into account data revisions for that period, and new trade weights were calculated for the three-year period from 1999 to 2001.

8. In 2007 a Eurosystem workshop recommended that the trade weights be updated more frequently. It was thus decided to update them every three years (instead of

³ See Schmitz, Martin, De Clercq, Maarten, Fidora, Michael, Lauro, Bernadette and Pinheiro, Cristina, "Revisiting the effective exchange rates of the euro", Occasional Paper Series, No 134, ECB, Frankfurt am Main, June 2012.

⁴ Harmonised competitiveness indicators for individual euro area countries, following the same methodology and data sources as the EERs, are also published on the ECB's website.

every five years) in order to reflect developments in the pattern of international trade in a more timely fashion.

9. In the second update of the trade weights, in 2009, the weighting scheme for 1995-97 (as calculated in 2004 and adjusted after the euro area enlargements) was maintained, and new trade weights were calculated on the basis of revised manufacturing trade data for the three-year periods 1998-2000, 2001-03 and 2004-06.

10. In the third update, carried out in January 2012, all existing weights were updated with revised manufacturing trade data; moreover, trade weights for the period from 2007 to 2009 were added.

11. In the fourth update, carried out in August 2015, all existing weights were updated with revised manufacturing trade data and trade weights for the period from 2010 to 2012 were added.

12. In the fifth update, carried out in August 2017, all existing weights were updated with revised manufacturing trade data and trade weights for the period from 2013 to 2015 were added. As a result, seven sets of trade weights are currently available, based on trade data for the periods 1995-97, 1998-2000, 2001-03, 2004-06, 2007-09, 2010-12 and 2013-15. Fixed chain-linking on a three-yearly basis is used for the EERs of the euro, so the indices are chain-linked at the end of each of the seven periods.

13. In the sixth update, carried out in July 2020, major methodological changes were introduced. For the first time, new trade weights were calculated combining manufacturing trade and services trade data for the period 1995-2018. As a result, eight sets of trade weights are currently available, based on trade data for the periods 1995-97, 1998-2000, 2001-03, 2004-06, 2007-09, 2010-12, 2013-15 and 2016-2018. Fixed chain-linking on a three-yearly basis is used for the EERs of the euro, so the indices are chain-linked at the end of each of the seven periods.

14. Besides these six updates, the overall trade weights and final EERs were recalculated every time there was an enlargement of the euro area, since a country joining Monetary Union is excluded from the groups of euro area trading partners and included in the euro area computations. Most recently, the trade weights underlying the calculation of the EERs of the euro and the harmonised competitiveness indicators (HCIs) of the euro area countries have been updated to reflect the enlargement of the European Union to include Croatia on 1 July 2013.

Deflators

15. Deflators for the real EERs are: consumer price indices (CPIs), producer price indices (PPIs), GDP deflators and unit labour costs, both for the total economy (ULCT) and for the manufacturing sector (ULCM). Deflator data are collected from several sources (mainly Eurostat, the OECD, the BIS and the IMF). For both the euro area and EU countries, the price and cost measures are based on harmonised concepts (the Harmonised Index of Consumer Prices, PPI, unit labour costs based on the European System of Accounts 2010 and GDP deflators). In cases where

deflators are only available with a time lag, the latest observations are estimated. The data are seasonally adjusted and, if quarterly data are not available, disaggregated from annual data.

16. EERs based on the complete set of deflators are calculated for the EER-12 group and the EER-19 group, while for the EER-42 group CPI and GDP are the only available deflators.

Exchange rates

17. The bilateral exchange rates used in the calculation are, in most cases, the ECB's official daily reference rates (if these are not available, indicative rates published by other international organisations are used).

18. For the period before 1 January 1999, the EERs are based on a basket of the currencies of the 11 countries that formed the euro area in January 1999. The weighted geometric averages of the exchange rates of the currencies of these countries are used to obtain a "proxy" euro exchange rate. The weights for the pre-1999 "theoretical" euro exchange rates are based on the share of each euro area country in the total manufacturing trade of the euro area with non-euro area countries in the period from 1995 to 1997.

Frequency and base period

19. The nominal EERs for the EER-12, EER-19 and EER-42 are available daily. All other indicators are available monthly, with the exception of the real EER indices based on ULCT, ULCM and GDP deflators, which are available quarterly. The base period for all indices is the first quarter of 1999 (i.e. 1999Q1 = 100).

Note to Tables 9.1

Chapter 9 – developments outside the euro area

Section 9.1 – economic and financial developments in other EU Member States

In general, the selected indicators for economic and financial developments in non-euro area EU Member States follow the same methodological, statistical and legal principles as those for euro area countries. In general, compliance of economic statistics for these countries with EU standards is better for recent observations than for older data. For each of the following indicators further details are available in the General notes in relation to the tables in previous sections of the Statistics Bulletin.

1. HICP

Article 1 of the Protocol on the convergence criteria referred to in Article 140 of the Treaty on the Functioning of the European Union requires price convergence to be measured by means of the consumer price index *on a comparable basis*. Given the differences between national consumer price indices (CPIs), Harmonised Indices of Consumer Prices (HICPs) were developed by the European Commission (Eurostat) in cooperation with the then and future Member States. For all countries shown, monthly data are published with a delay of 10 to 20 days from the end of the month.

For further details see the methodological note to Section 5.1, "HICP, other prices and costs".

2. General government deficit (-)/surplus (+) and general government gross debt

The deficit and debt figures of individual countries are fully consistent with the excessive deficit procedure statistics released by Eurostat. They comply with the European System of Accounts 2010 (ESA 2010) and Council Regulation (EC) No 479/2009.

3. Long-term government bond yield

Article 4 of the Protocol on the convergence criteria referred to in Article 140 of the Treaty on the Functioning of the European Union states that interest rate levels are to

be measured on the basis of long-term government bonds or comparable securities, taking into account differences in national definitions. The statistical definition of the long-term interest rate for the EU Member States was specified, in close liaison with the European Commission, as part of the preparations for Stage Three of Economic and Monetary Union . For Cyprus and Lithuania, primary market yields are reported. The same applies to Slovenia up to October 2003 and to Bulgaria and Romania up to December 2005. As Estonia has very limited government debt, there are currently no suitable long-term government bonds available on the financial market.

4. Three-month interest rate

The three-month money market rates are period averages of the domestic interbank offered rates expressed as percentages per annum.

5. Real GDP

As is the case with all national accounts data, gross domestic product (GDP) in volume (or real as often used by economists) is compiled according to the harmonised accounting definitions and methodology in the ESA 2010. The legal deadline for providing data is, at the latest, 60 days after the end of the reference period. The annual percentage changes shown in the table are calculated from seasonally unadjusted quarterly data. For further details see the methodological note for Section 5.2, "Output and demand".

6. Current and capital accounts

National balance of payments (b.o.p.) data are an important criterion in the assessment of a (non-euro area) country's economic situation and convergence (Article 119 of the Treaty).

The current and capital account balance represents the amount of an economy's net foreign investment, or net lending to or borrowing from, the rest of the world. This ratio to GDP is a commonly used indicator enabling international data to be easily compared.

Regarding the methodological standards used to compile b.o.p. data, all non-euro area EU Member States have adopted the standards set out in the sixth edition of the IMF's Balance of Payments and International Investment Position Manual, and largely follow the recommendations made there as well as those laid down by the ECB and the European Commission for the compilation of the euro area and EU aggregate. Further details on the methodology are available on the ECB's website.¹

¹ <http://www.ecb.europa.eu/stats/external/balance/html/index.en.html>

7. Gross external debt

Gross external debt statistics show the outstanding amount of an economy's actual current (i.e. non-contingent) liabilities that require payment of principal and/or interest to non-residents at some point in the future.

Further methodological information on these statistics is available on the ECB's website.¹

8. Unit labour costs

Unit labour costs data are derived from ESA 2010 national accounts data. The calculation method for unit labour costs is explained in more detail in the methodological note to Section 5.1, "HICP, other prices and costs".

9. Standardised unemployment rate

Standardised unemployment data are calculated on the basis of data from the European Union's quarterly Labour Force Survey (LFS), which are then extrapolated using data from the same source or national registers. Some of the revisions of the new Member States' monthly standardised unemployment data may be significant, especially when a new benchmark LFS becomes available.

More information on the calculation methods can be found in the methodological note for Section 5.3, "Labour markets".
